

ABB MEASUREMENT & ANALYTICS | DATA SHEET

Advance Optima AO2000

Continuous gas analyzers

ENGINEERED
TO OUTRUN

Measurement made easy

Modular continuous gas analyzers

A wide variety of measurement technology

- Analyzer modules for all process and emission monitoring applications
 - Up to four analyzer modules handling a total of six sample components
 - 'Safety concept' for measuring flammable gases in Zone 2 and for measuring corrosive and toxic gases
 - Performance-tested for emission monitoring in accordance with EN 15267
-

Versatile, easy to use

- Common controls, common connection technology
 - Automatic calibration with air or integral calibration cells eliminating the need for test gas cylinders
 - Modular design for ease of service
 - Self-monitoring function indicates when maintenance is required
-

Application-oriented design

- Housing design for 19-inch rack mounting or wall mounting
 - Optional gas extraction
 - Ethernet, Modbus® and PROFIBUS® interfaces
 - Configurable analog and digital inputs and outputs
-

User-friendly operation

- Simultaneous numeric display and bar graph of measured values on a large graphics panel
- Menu-driven operator interface
- Clear-text status messages

Overview

The modular product line

Advance Optima AO2000 Series is a modular product line used for continuous process gas analysis.

The product line consists of the following modules:

- Analyzer modules,
- Pneumatic module,
- Electronics module with system controller and I/O modules,
- Housing with display and control unit and
- System bus.

The modules can be arranged in various ways to form single or multiple analyzer systems.

The electronics module, power supply and housing with display and control unit are also collectively referred to as the 'central unit'.

Measuring technology (analyzer modules)

The following analyzer modules are available for selection:

Analyzer module	Measuring task	Measurement-related data
Infrared photometer Uras26	Measurement of for example CO ₂ , CO, NO, SO ₂	Uras26 infrared photometer from page 7 onwards
Ultraviolet photometer Limas21 UV , Limas21 HW	Measurement of for example NO, NO ₂ and SO ₂ .	Ultraviolet photometer Limas21 UV from page 10 onwards Ultraviolet Photometer Limas21 HW from page 14 onwards
Oxygen analyzer Magnos28	Measurement of O ₂ in operating gas or in N ₂	Oxygen analyzer Magnos28 from page 18 onwards
Oxygen analyzer Magnos27	Measurement of O ₂ in flue gas or in N ₂	Oxygen analyzer Magnos27 from page 21 onwards
Trace oxygen analyzer ZO23	Measurement of O ₂ in pure gases	Trace oxygen analyzer ZO23 from page 23 onwards
Thermal conductivity analyzer Caldos25 , Caldos27	Measurement of binary mixtures such as Ar in O ₂ , H ₂ in Ar, CH ₄ in N ₂	Thermal conductivity analyzer Caldos25 from page 26 onwards Thermal conductivity analyzer Caldos27 from page 29 onwards
Flame ionization detector Fidas24 , Fidas24 Ex , Fidas24 NMHC	Measurement of hydrocarbons	FID analyzer Fidas24 from page 33 onwards FID analyzer Fidas24 NMHC from page 37 onwards AO2040-Fidas24 Ex for use in Zone 1, 21 und Zone 2, 22 from page 41 onwards
Laser analyzer in LS25	Measurement in the near infrared spectrum e.g. O ₂ , NH ₃ , H ₂ O, CO, HCL	Laser analyzer LS25 from page 47 onwards
Electrochemical oxygen sensor	Measurement of O ₂	Electrochemical oxygen sensor from page 55 onwards

Each analyzer module consists of the sensor and associated electronics having its own processor.

The analyzer modules are connected to the system controller through the system bus. The external laser analyzer module LS25 is connected to the central unit via Ethernet.

The analyzer modules are supplied with DC 24 V from an integral power supply or an external unit.

The electrochemical oxygen sensor is assigned to an analyzer module as part of the pneumatic module.

... Overview

Pneumatic Module

When fully equipped, the pneumatic module includes one or three solenoid valves for test gas supply, one or two disposable filters for fine filtration, a pump with coarse filter and capillary tube for gas feed, one or two flow sensors for flow monitoring and an electrochemical oxygen sensor.

The pneumatics module is always associated with an analyzer module and installed in the same housing as the analyzer module.

Housing design

The system housing is designed as a 19" housing (model AO2020) or as a wall-mounted housing (model AO2040).

A version that can be purged is also available, see **Housing purge** on page 64.

The display and control unit is located on the front panel of the housing when the electronics module is installed.

IP rating

The IP rating of the housing depends on the housing design and the analyzer modules installed.

Version / analyzer module	IP20	IP40	IP54	IP65
Without connection box	X			
Version for emission measurement		X		
With connection box and Limas21 HW, Magnos27, Fidas24*, ZO32			X*	
With connection box and Uras26, Limas21, Magnos28, Caldos25, Caldos27				X
Version that can be purged (option)			X	X
AO2040-Fidas24 Ex				X

* IP rating IP54 not for the pressure equalization opening of the Fidas24, see **Gas and electric connections Fidas24 and Fidas24 NMHC** on page 81.

Note

For combinations of analyzer modules, the lower IP rating applies. Example:

When combining Uras26 (IP65) with Magnos27 (IP54), the resulting IP rating is then **IP54**.

Electronics module, interfaces

The electronics module incorporates the system controller with the I/O-modules.

The **system controller** carries out the following functions:

- Processing and communicating the measured values supplied by the analyzer module sensor electronics,
- Compensating measured values, e.g. cross sensitivity correction,
- Controlling system functions, e.g. calibration.
- Display and control functions,
- Controlling associated systems, e.g. gas supply,
- Communicating with external systems.

The system controller communicates with the other functional units of the gas analyzer, such as the analyzer modules, via the system bus.

Interfaces for controlling associated systems and for communicating with external systems are located on the system controller (Ethernet 10/100/1000BASE-T interface) and on the I/O modules.

The **I/O modules** are attached and directly connected to the system controller board. There are six types of I/O modules:

- PROFIBUS® module with one RS485 and one MBP interface,
- Modbus® module with one RS485 and one RS232 interface,
- Digital I/O module with four digital inputs and four digital outputs,
- 2-way analog output modules have two analog outputs,
- 4-way analog output modules have four analog outputs,
- 4-way analog input modules have four analog inputs.

Examples of I/O module applications include:

- Output of measured values as current signals,
- Output of status and alarm signals,
- Calibration control,
- Control of external solenoid valves and pumps,
- Measuring range switching and feedback,
- Feed of current or status signals from external analyzers,
- Feed of status signals from peripherals.

System bus

The gas analyzer's functional units are interconnected via the system bus.

The system bus structure is linear with a maximum length of 350 meters.

Only one electronics module with up to five I/O modules should be connected to a system bus structure.

Sample gas line conditioning

The SCC-F sample gas feed unit and the SCC-C sample gas cooler can be connected to the gas analyzer via the system bus by means of an I/O board installed in the sample gas feed unit.

Thus it is possible to display, monitor and control individual sample gas conditioning functions in the gas analyzer, such as cooler temperature or condensate and flow status.

For further information, please refer to the 'DS/SCC – System components and accessories for sample gas conditioning' data sheet.

Notes on the metrological data of the analyzer modules

- The metrological data for the analyzer modules apply only when operated in conjunction with the central unit.
- The measurement-related data has been determined in accordance with IEC 61207-1:2010 'Expression of performance of gas analyzers – Part 1: General'. They are based on operation at atmospheric pressure (1013 hPa) and nitrogen as the associated gas. Compliance with these characteristics when measuring other gas mixtures can only be assured if their composition is known.
- The physical detection limit is the lower limit of the measurement-related data relative to the measuring range span.

... Overview

Configuration of analyzer units and multiple analyzer systems

This data sheet contains specifications for all modules in the Advance Optima AO2000 Series modular product line.

This data sheet was not intended to be used for configuring an analyzer unit or a multiple analyzer system. For a quotation please contact your ABB sales representative who can also provide advice and support during configuration.

Example 1 shows the modules and components that normally make up an analyzer unit as well as the selection possibilities for configuring an analyzer unit.

The modular product line allows modules and components to be formed into an analyzer unit (see **Example 1**) or into multiple analyzer systems (**Example 2**).

Example 1: Variant of an analyzer in a 19" housing (AO2020)

- Housing with display and control unit (see page 63)
- Housing type
 - with/without display and control unit
 - Power supply (unless otherwise specified on electronics module)

+

- Electronics module (see page 68)
- Power supply
 - I/O module equipment
 - Interfaces
 - Power supply (see page 65)

+

- Analyzer module (see page 7 to page 55)
- Gas path design
 - Gas connections
 - Type of installation
 - Analyzer-specific data

=

- System configuration
- Number of housings
 - Number of analyzer modules
 - System bus wiring
 - DC 24 V analyzer power supply

Example 2: Variant of a multi-analyzer in a wall-mounted housing (AO2040)

Uras26 infrared photometer

Measuring principle

Non-dispersive infrared absorption

Photometer with 1 or 2 beam paths (gas paths) to measure up to 4 sample components

Sample components and measurement ranges

The Uras26 analyzer module has one physical measurement range per sample component. As an option, smaller measuring ranges can be electronically derived from the physical measurement range. The smallest range is measurement range 1.

The smallest measuring ranges specified in the following table refer to the 1st Measuring component of an optical path.

Sample component	Smallest class 1 range	Smallest class 2 range	Smallest meas. range Class 2 with calibration cell	Gas group*
CO	0 to 50 ppm	0 to 10 ppm	0 to 50 ppm**	A
CO ₂	0 to 50 ppm	0 to 5 ppm	0 to 25 ppm**	A
NO	0 to 75 ppm	0 to 75 ppm	0 to 75 ppm**	A
SO ₂	0 to 100 ppm	0 to 25 ppm	0 to 25 ppm**	A
N ₂ O	0 to 50 ppm	0 to 20 ppm	0 to 50 ppm**	A
CH ₄	0 to 100 ppm	0 to 50 ppm	0 to 50 ppm**	A
NH ₃	0 to 500 ppm	0 to 30 ppm	–	B
C ₂ H ₂	0 to 200 ppm	0 to 100 ppm	0 to 100 ppm	B
C ₂ H ₄	0 to 500 ppm	0 to 300 ppm	0 to 300 ppm	B
C ₂ H ₆	0 to 100 ppm	0 to 50 ppm	0 to 50 ppm**	B
C ₃ H ₆	0 to 250 ppm	0 to 100 ppm	0 to 100 ppm**	B
C ₃ H ₈	0 to 100 ppm	0 to 50 ppm	0 to 50 ppm**	B
C ₄ H ₁₀	0 to 100 ppm	0 to 50 ppm	0 to 50 ppm**	B
C ₆ H ₁₄	0 to 500 ppm	0 to 100 ppm	0 to 100 ppm**	B
SF ₆	0 to 5 ppm	0 to 4 ppm	–	B
H ₂ O	0 to 1000 ppm	0 to 500 ppm	0 to 500 ppm	C

* See price information

** The smallest measuring range 1 is shown. The largest measurement range should be at least four times larger.

Note

Other sample components on request.

Number of measuring ranges

1 to 4 measuring ranges per sample component

Largest measuring range

0 to 100 vol.-% or 0 vol.-% to saturation or 0 vol.-% to LEL
Measuring ranges within ignition limits cannot be provided.

Measuring range ratio

≤ 1:20

Suppressed measuring ranges

Electronic zero-point suppression or differential measurement based on a base level > 0 with flowing reference gas, max. suppression ratio of 1:10.

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They relate to the smallest measurement range.

Linearity error

≤ 1 % of span

Option: Linearization in accordance with EPA- specifications for automotive exhaust gas measurement

Repeatability

≤ 0.5 % of span

Zero drift

≤ 1 % of the measuring span per week;
for measuring ranges smaller than Class 1 up to Class 2:
≤ 3 % of span per week

Span drift

≤ 1 % of measured value per week

Output signal fluctuation (2 σ)

≤ 0.2 % of span at electronic T₉₀- time
= 5 s (class 1) or = 15 s (class 2)

Detection limit (4 σ)

≤ 0.4 % of the measuring span at electronic T₉₀ time
= 5 sec (Class 1) or = 15 sec (Class 2)

... Uras26 infrared photometer

Influences

Flow effect

Flow rate in the 20 to 100 l/h range:
Within the detection limit

Associated gas effect/cross sensitivity

Analyzer calibration should be based on an analysis of the sample gas.

Selectivation measures to reduce the associated gas effect (options):
Incorporation of interference filters or filter cells, internal electronic cross-sensitivity or carrier gas correction for one sample component by other sample components measured with the Uras26.

Temperature effect

Ambient temperature in permissible range

- At the zero point:
≤ 1 % of the span per 10 °C; for measuring ranges smaller than class 1 to class 2:
≤ 2 % of the span per 10 °C
- On the sensitivity with temperature compensation:
≤ 3 % of the measured value per 10 °C
- On the sensitivity with thermostat effect at 55 °C (optional): ≤ 1 % of the measured value per 10 °C

Air pressure effect

- At the zero point:
no influence effect
- On sensitivity with pressure correction using an integrated pressure sensor:
≤ 0.2 % of the measured value per 1 % of air pressure change

Power supply effect

DC 24 V ± 5 %: ≤ 0.2 % of span

Dynamic response

Warm-up time

approx. 30 minutes without thermostat; approx. 2 hours with thermostat.

T₉₀ time

T₉₀ = 2.5 sec for measurement cell length = 200 mm and sample gas flow = 60 l/h without signal damping (low pass filter). Low-pass time constant adjustable from 0 to 60 sec

Calibration

Calibration	Test gas
Zero-point calibration	With inert gas, e.g. nitrogen, or with ambient air that is free of the sample component.
End-point calibration	With test gas or with calibration cells filled with gas (option). It is recommended to verify the calibration cell set values once a year.

Note

When calibrating a multi-component analyzer, test gas mixtures can also be used if there are no cross-sensitivities between them. During calibration, possible electronic cross-sensitivity corrections are switched off, therefore, corrected measurement components should be calibrated only using a test gas consisting of the measurement component and an inert gas such as nitrogen.

Materials

Analyzer (sample cells)

- Tube: Aluminum or gold-plated aluminum;
- Window: CaF₂, option: BaF₂;
- Connection socket: Stainless steel 1.4571 (AISI 316Ti)

Gas lines and connectors

- Gas lines: FPM hoses or PTFE pipes with stainless steel connections;
Option: Pipes made of stainless steel 1.4571
- Gas connections: stainless steel 1.4571

Gas connections

Refer to **Gas connections** on page 8

Sample gas conditions

Sample gas inlet conditions

Uras26 – sample gas input conditions

Temperature

If the sample gas taken from the process is hotter than the coldest point in the sample gas path, there may be condensation at this point, if the gas contains components that can condense.

Therefore, the sample gas dew point should be at least 5 °C below the lowest temperature throughout the sample gas path. Otherwise a sample gas cooler or condensate trap is an absolute requirement.

Pressure

Internal pressure drop:	< 5 hPa at standard flow rate of 60 l/h
Permissible absolute pressure range:	800 to 1250 hPa Operation under lower absolute pressure (e.g. at altitudes above 2000 m) on request
Gauge pressure in the sample cell:	max. 500 hPa
Flow rate	20 to 100 l/h

Corrosive gases

Highly corrosive associated gas components, e.g. chlorine (Cl_2) and hydrogen chloride (e.g. HCl), as well as gases or aerosols containing chlorine must be cooled or undergo prior absorption. Provide for housing purge.

Flammable gases

- The analyzer module is suited for the measurement of flammable gases and vapors under atmospheric conditions ($p_{\text{abs}} \leq 1.1 \text{ bar}$, oxygen content $\leq 21 \text{ vol.-%}$). Temperature class: T4.
- The sample gas may not be explosive in standard operation; If the sample gas is explosive in the event of a sample gas supply failure, then only seldom and briefly (in accordance with Zone 2).
- Pressure in the sample gas path in standard operation $p_e \leq 100 \text{ hPa}$; in case of a sample gas supply failure the pressure must not up-scale the maximum value $p_e = 500 \text{ hPa}$.
- The version with gas paths designed as stainless steel tubes should be selected and housing purge with nitrogen should be provided when measuring flammable gases and vapors.
- Before using the analyzer module, the corrosion resistance against the specific sample gas must be checked.
- The pressure sensor must not be connected to the sample gas path.

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Ultraviolet photometer Limas21 UV

Measuring principle

Gas filter correlation or wavelength comparison in ultraviolet and visible spectrum range $\lambda = 200$ to 600 nm

Photometer to measure from 1 to 4 components.

Sample cells made from various materials are available for measurement in corrosive, toxic and flammable gases (see **Sample cells for Limas21 UV, Limas21 HW** on page 13).

Sample components and measurement ranges

The Limas21 UV analyzer module has one physical measurement range per sample component. As an option, smaller measuring ranges can be electronically derived from the physical measurement range. The smallest range is measurement range 1.

Sample component	Smallest class 1 range	Smallest class 2 range	Gas group*
NO**	0 to 50 ppm	0 to 10 ppm	A
SO ₂	0 to 150 ppm	0 to 25 ppm	A
NO ₂	0 to 250 ppm	0 to 50 ppm	B
NH ₃	0 to 100 ppm	0 to 30 ppm	B
H ₂ S	0 to 50 ppm	0 to 25 ppm	B
Cl ₂	0 to 250 ppm	0 to 100 ppm	D
CS ₂	0 to 100 ppm	0 to 50 ppm	C
COS	0 to 500 ppm	0 to 250 ppm	C

* See price information

** The UV-RAS (ultra-violet resonant absorption spectroscopy) method is used to make the analyzer selective to the sample component NO.

Other sample components on request.

Number of measuring ranges

1 to 4 measuring ranges per sample component

Largest measuring range

0 to 100 vol.% or 0 vol.% to saturation or 0 vol.% to LEL
Measuring ranges within ignition limits cannot be provided.

Measuring range ratio

Measurement ranges freely adjustable within a range ratio of 1:20 relative to the factory-set reference measuring range

Measuring ranges with suppressed zero point

Electronic zero-point suppression, max. suppression ratio of 1:10

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They apply to measurement range 1 in a delivered analyzer module.

Linearity error

≤ 1 % of span; option: Linearization according to EPA specification for vehicle exhaust measurements

Repeatability

≤ 0.5 % of span

Zero drift

- ≤ 2 % of span per week.
- ≤ 1.5 % of the measuring span per day
(Recommendation: daily automatic zero point calibration)

Span drift

≤ 1 % of measured value per week

Output signal fluctuation (2σ)

≤ 0.5 % of span with electronic T_{90} -time = 10 s;
for measuring ranges smaller than Class 1 to Class 2:
 ≤ 1 % of span

Detection limit (4σ)

≤ 1 % of the measuring span; for ranges smaller than Class 1 to Class 2: ≤ 2 % of span

Influences

Flow effect

Flow rate in the range 20 to 100 l/h:
Selectivity measures to reduce associated gas effect (optional):

Associated gas effect/cross sensitivity

Analyzer calibration should be based on an analysis of the sample gas.

At zero-point:
Installation of filter cells or internal electronic cross-sensitivity correction or carrier gas correction for a sample component by other sample components measured with the Limas21.

Temperature effect

no influence effect; -On sensitivity without pressure correction:

- At zero point:
 - $\leq 1\%$ of the span per $10\text{ }^{\circ}\text{C}$;
for measuring ranges smaller than Class 1 to Class 2:
 - $\leq 2\%$ of the span per $10\text{ }^{\circ}\text{C}$
- On sensitivity:
 - $\leq 1\%$ of the measured value per $10\text{ }^{\circ}\text{C}$

Air pressure effect

- At zero point:
 - No effect
- On sensitivity with pressure correction using an integrated pressure sensor:
 - $\leq 0.2\%$ of the measured value per 1% air pressure change

Power supply effect

DC $24\text{ V} \pm 5\%$: $\leq 0.2\%$ of span

Dynamic response

Warm-up time

Approx. 2.5 hour

T₉₀ time

T₉₀ = 4 s for measurement cell length = 262 mm and sample gas flow = 60 l/h without signal damping (low pass filter). Low-pass time constant adjustable from 0 to 60 sec

Calibration

Zero-point calibration

With inert gas, e.g. nitrogen, or with ambient air that is free of the sample component.

End-point calibration

with gas-filled calibration cells (optional) or with test gas. It is recommended to verify the calibration cell set values once a year.

During calibration of a multi-component analyzer, possible cross-sensitivity and/or carrier gas corrections by internal or external measurement components are switched off. Therefore, corrected measurement components should be calibrated only using a test gas consisting of the measurement component and an inert gas such as nitrogen.

1) See also **Sample gas inlet conditions** on page 12.

2) purge curtain

3) p_e = 7 to 20 hPa, flow 15 to 20 l/h

4) The analyzer module is suited for the measurement of flammable gases and vapors under atmospheric conditions (p_{abs} ≤ 1.1 bar, oxygen content ≤ 21 vol.%). Temperature class: T4. The sample gas must not be explosive at normal operation.

Pressure in the sample gas path in standard operation p_e ≤ 100 hPa; in case of a sample gas supply failure the pressure must not up-scale the maximum value p_e = 500 hPa. Before using the analyzer module, the corrosion resistance against the specific sample gas must be checked.

Ultraviolet Photometer Limas21 HW

Measuring principle and application

Limas21 HW is a multi-component analyzer for simultaneous measurement of nitrogen compounds in wet sulfur-free flue gas without converter.

Measurement principle

Photometer to measure NO, NO₂ and NH₃.

Selectivation on the sample component NO using the UV-RAS (ultra-violet resonant absorption spectroscopy) method.

Wavelength comparison in ultraviolet spectrum range
λ = 200 to 600 nm.

Application

Exhaust gas measurement for the development of combustion engines and methods for exhaust gas after-treatment, in particular for pure gas measurement after catalyst in:

- Four-stroke gasoline and diesel engines,
- Catalysts for nitrogen oxide reduction.

Process measurement e.g. for monitoring, controlling and optimizing DeNOx SCR processes.

Sample components and measuring ranges (recommendations), stability data

Exhaust gas measurement for four-stroke gasoline and diesel engines

Sample component	Smallest measurement range	Largest range
NO	0 to 100 ppm	0 to 5000 ppm
NO ₂	0 to 100 ppm	0 to 2500 ppm

Linearity error

- ≤ 1 % of span.
- ≤ 2 % of measured value in accordance with EPA-specifications for automotive exhaust gas measurement

Repeatability

- ≤ 0.25 % of span

Zero drift

- ≤ 1 ppm or ≤ 1 % of span per 24 hours based on the smallest recommended measuring range (daily automatic zero point calibration recommended)

Span drift

- ≤ 1 % of measured value per week

Output signal fluctuation (2 σ)

- ≤ 400 ppb or ≤ 0.4 % of span at electronic
- T₉₀ time = 5 s

Detection limit (4 σ)

- ≤ 800 ppb or ≤ 0.8 % of span at electronic
- T₉₀ time = 5 s

Diluted exhaust gas measurement for four-stroke gasoline and diesel engines, bag measurement

Sample component	Smallest measurement range	Largest range
NO	0 to 10 ppm	0 to 500 ppm
NO ₂	0 to 10 ppm	0 to 500 ppm

Linearity error

- ≤ 1 % of span.
- ≤ 2 % of measured value in accordance with EPA-specifications for automotive exhaust gas measurement

Repeatability

- ≤ 0.25 % of span

Zero drift

- ≤ 250 ppb or ≤ 2 % of the span per 8 hours based on the smallest recommended measuring range (daily automatic zero point calibration recommended)

Span drift

- ≤ 1 % of measured value per week

Output signal fluctuation (2 σ)

- NO: ≤ 50 ppb or ≤ 0.5 % of span,
- NO₂: ≤ 60 ppb or ≤ 0.5 % of span at electronic T₉₀ time = 15 s

Detection limit (4 σ)

- NO: ≤ 100 ppb or ≤ 1 % of span,
- NO₂: ≤ 120 ppb or ≤ 1 % of span at electronic T₉₀ time = 15 s

Process measurement

Sample component	Smallest measurement range	Largest range
NO	0 to 100 ppm	0 to 1000 ppm
NO ₂	0 to 100 ppm	0 to 500 ppm
NH ₃	0 to 100 ppm	0 to 500 ppm

Linearity error

- ≤ 1 % of span

Repeatability

- ≤ 0.25 % of span

Zero drift

- ≤ 1 ppm or ≤ 1 % of span per 24 hours based on the smallest recommended measuring range (daily automatic zero point calibration recommended)

Span drift

- ≤ 1 % of measured value per week

Output signal fluctuation (2 σ)

- ≤ 150 ppb or ≤ 0.15 % of span at electronic T₉₀ time = 30 s

Detection limit (4 σ)

- ≤ 300 ppb or ≤ 0.3 % of span at electronic T₉₀ time = 30 s

Measuring ranges**Quantity**

- 1 to 4 measuring ranges per sample component

Measuring range ratio

- Max. 1:20; Measuring ranges freely adjustable within a range ratio of 1:20 relative to the factory-set reference measuring range;

- Max. 1:50 for fixed measuring ranges in accordance with EPA-specifications for automotive exhaust gas measurement.

... Ultraviolet Photometer Limas21 HW

Influences

Flow effect

Flow rate in the 20 to 90 l/h range: within the detection limit

Associated gas effect/cross sensitivity

Analyzer calibration should be based on an analysis of the sample gas.

Selectivation measures to reduce associated gas effect: Internal electronic cross-sensitivity correction or carrier gas correction for a sample component by other sample components measured with the Limas21 HW.

Temperature effect

Ambient temperature in permissible range,
Sample cell thermostat control to +80 °C

- At zero point:
≤ 2 % of the span per 10 °C
- On sensitivity:
≤ 2 % of the measured value per 10 °C

Air pressure effect

- At zero point:
No effect
- On sensitivity with pressure correction using an integrated pressure sensor:
≤ 0.2 % of the measured value per 1 % air pressure change

Power supply effect

DC 24 V ± 5 %: ≤ 0.2 % of span

Dynamic response

Warm-up time

Approx. 4 hour

T₉₀time

T₉₀ ≤ 5 sec for measurement cell length = 260 mm and sample gas flow = 60 l/h with non-linear filter (static/dynamic) = 15/1 s
Low-pass time constant adjustable from 0 to 30 s

Calibration

Zero-point calibration

With inert gas, e.g. nitrogen, or with ambient air that is free of the sample component.

End-point calibration

with gas-filled calibration cells (optional) or with test gas. It is recommended to verify the calibration cell set values once a year.

During calibration of a multi-component analyzer, possible cross-sensitivity and/or carrier gas corrections by internal or external measurement components are switched off. Therefore, corrected measurement components should be calibrated only using a test gas consisting of the measurement component and an inert gas such as nitrogen.

Materials

Sample cell

Pipe and window: Quartz glass, screw connection: PVDF, connection piece: PTFE

Gas lines

PTFE, FPM

Gas connections

Stainless steel 1.4571 (AISI 303), 1.4305 (AISI 316Ti)

Housing purge

Purge gas

Sample component-free air or nitrogen Purge gas flow rate ≤ 10 l/h

Sample gas conditions

Sample gas inlet conditions

Limas21 HW – sample gas input conditions

Sample gas composition

Sulfur-free exhaust gas of combustors,
 SO_2 concentration < 25 ppm, $\text{H}_2\text{O} < 20$ vol.%,
 filtered with pore width ≤ 0.5 μm

Temperature

If the sample gas taken from the process is hotter than the coldest point in the sample gas path, it can condensate there, if the gas contains components that can condense.

Therefore, the sample gas dew point should be at least 5 °C below the lowest temperature throughout the sample gas path. Otherwise a sample gas cooler or condensate trap is an absolute requirement.

Pressure

Internal pressure drop:	< 5 hPa at standard flow rate of 60 l/h
Permissible absolute pressure range:	800 to 1250 hPa. Operation under lower absolute pressure (e.g. at altitudes above 2000 m) on request

Gauge pressure in the sample cell:	max. 500 hPa
------------------------------------	--------------

Flow rate	20 to 90 l/h
-----------	--------------

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Gas connections

Refer to **Limas21** on page 74.

Notes

- The Limas21 HW analyzer module can only be mounted in the 19" housing.
- SO_2 influences the NH_3 measured value. If the sample gas mixture contains SO_2 , the requirement of internal corrections must be scrutinized. When ordering the average water vapor concentration has to be specified. The influence is corrected internally.

Sample conditioning system requirements

Sample gas feed-in

The various applications require the sample gas feed-in to the gas analyzer at temperatures of 150 to 190 °C.

It is imperative to eliminate condensation and resublimation since NO_2 and NH_3 are easy soluble in water and can lead to salification. It is also imperative to prevent condensation of potentially present low-boiling hydrocarbons.

Sample gas inlet temperature

150 to 190 °C

Sample gas filter

During the measurement of NO and NO_2 : Sintered metal
 During the measurement of NH_3 : Ceramic; pore size $\leq 0,5$ μm

Materials

PTFE, PVDF or Silicosteel®

Oxygen analyzer Magnos28

Measuring principle

Paramagnetic oxygen analyzer

Sample components and measurement ranges

Sample component	Smallest measurement range	Largest range
Oxygen (O ₂)	0 to 0.5 vol. %	0 to 100 vol. %

Number of measuring ranges

There are four available measuring ranges. The measuring range limits can be freely configured on the device.

The measuring range limits are set to 0 to 10/15/25/100 vol. % O₂ or in accordance with the order.

Note

Measurement ranges should not be set within ignition limits.

Measuring ranges with suppressed zero point

Suppressed measuring ranges can be freely adjusted in the range from 0 to 100 vol.-%. Multiple measuring ranges must be overlapping.

The minimum measuring span is 0.5 vol.-%.

For suppressed measuring ranges, pressure correction using a pressure sensor is required. If the analyzer has been ordered with the suppressed measuring range, a pressure sensor will be installed at the factory.

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They relate to the smallest measurement range.

Linearity error

≤ 0.5 % of the measuring span or ≤ 0.005 vol. % O₂, the greater value applies

Repeatability

≤ 50 ppm O₂

Zero drift

≤ 0.05 vol.-% O₂ per week

The value may be elevated during first commissioning or after a longer service life.

Span drift

Drift per week: ≤ 0.2 % of the measured value or ≤ 0.01 vol. % O₂, the greater value applies

Output signal fluctuation (2 σ)

≤ 25 ppm O₂ at electronic T₉₀ time (static/dynamic) = 3/0 sec

Detection limit (4 σ)

≤ 50 ppm O₂ at electronic T₉₀ time (static/dynamic) = 3/0 sec

Influences

Flow effect

- Sample gas N₂:
≤ 0.1 vol. % O₂ in the permissible flow range;
- Sample gas air:
≤ 0.1 vol. % O₂ at a flow rate change of 10 l/h

Associated gas effect

Information on the influence of associated gases can be found in IEC 61207-3:2002 'Gas analyzers – Expression of performance – Part 3: Paramagnetic oxygen analyzers'.

Temperature effect

Average temperature effect in permissible ambient temperature range:

- At zero point:
≤ 0.02 vol. % O₂ per 10 °C
- On sensitivity:
≤ 0.3 % of the measured value per 10 °C
- For suppressed measuring ranges (if configured at the factory):
≤ 0.01 vol. % per 10 °C in the entire measuring range

Thermostat temperature: 60 °C

For suppressed and very small measuring ranges (≤ 0 to 1 vol. % O₂), greater temperature fluctuations (≥ 5 °C) at the installation site should be avoided.

Air pressure effect

- On sensitivity without pressure correction:
≤ 1 % of the measured value per 1 % air pressure change
 - On sensitivity with pressure correction using an integrated pressure sensor (option):
≤ 0.1 % of the measured value per 1 % air pressure change
- For suppressed measuring ranges:
≤ 0.01 % of the measured value per 1 % air pressure change
or ≤ 0.002 vol.-% O₂ per 1 % air pressure change, the greater value applies

Power supply effect

DC 24 V ± 5 %:

Selectivity measures to reduce associated gas effect (optional):

Position effect

Zero-point shift ≤ 0.05 vol. % O₂ per 1° deviation from horizontal location.

Position has no effect on the hard-mounted unit.

Dynamic response

Warm-up time

The analyzer typically reaches the specified zero point drift per week after 2 h.

For measuring spans of < 0 to 5 % as well as on initial commissioning or after a longer service life, the value may be higher.

T₉₀time

T₉₀ ≤ 3 sec at a sample gas flow of 90 l/h and electronic T₉₀ time (static/dynamic) = 3/0 sec, gas change from nitrogen to air (applies to a gas analyzer only with Magnos28)

Calibration

Calibration	Test gas
Zero-point calibration	Oxygen-free operating gas or with substitute gas
End-point calibration	Operating gas with a known oxygen concentration or a substitute gas such as dried air.
Single-point calibration (For measuring ranges higher 0 to 5 vol. % O ₂)	Zero point gas or operating gas with known oxygen concentration
Measurement ranges with suppressed zero-point	Suppressed measuring ranges should be calibrated for the greatest possible accuracy with high-accuracy purity gases or test gases. For calibration recommendation see the following table.

Test gases for suppressed measuring ranges

Upper range value	Zero gas point	End point gas
Up to 100 vol. % O ₂	N ₂	100 % O ₂
Up to about 21 vol. % O ₂	N ₂	Instrument air or high-purity test gas

... Oxygen analyzer Magnos28

Materials

Analyzer

- Sample chamber: • Stainless steel 1.4305, nickel alloy, glass, PtNi, silicon, gold, PTFE
- Gaskets: FPM, option: FFKM75

Sample gas conditions

Sample gas inlet conditions

Magnos28 – sample gas input conditions

Temperature

- If the sample gas taken from the process is hotter than the coldest point in the sample gas path, there may be condensation at this point, if the gas contains components that can condense. Therefore, the sample gas dew point should be at least 5 °C below the lowest temperature throughout the sample gas path. Otherwise a sample gas cooler or condensate trap is an absolute requirement.
- When there is a direct connection to the sample chamber, the maximum sample gas dew point is 55 °C.
- Water vapor content variations cause volume errors.

Designation of gas connections

Internal pressure drop:	< 5 hPa at standard flow rate of 60 l/h.
Permissible absolute pressure range:	800 to 1600 hPa. Operation under lower absolute pressure (e.g. at altitudes above 2000 m) on request.
Operation in non-hazardous areas (GP)	• Non-flammable sample gases: max. 1.6 bar • Flammable sample gases: max. 1,2 bar
Operation in potentially explosive areas (zone 2)	• Non-flammable sample gases: max. 1.6 bar • Flammable sample gases: max. 1,1 bar
Operation under higher pressure.	A pressure sensor is required to compensate for pressure influences.
Absolute pressure ≤ 1250 hPa:	An optional internal pressure sensor can be connected to the sample gas path.
Absolute pressure ≥ 1250 hPa:	An external pressure sensor must be connected to the sample gas path. See Note - Pressure compensation with external pressure sensor on page 20

The analyzer module is function-tested for 5000 hPa internal pressure without damage.

Flow rate	30 to 90 l/h; measuring ranges ≤ 0 to 3 vol % O ₂ : 60l/h For highly suppressed measuring ranges and measuring ranges of ≤ 0 to 3 vol % O ₂ , changes of the sample gas flow should be avoided.
------------------	---

Corrosive gases

- Consultation with ABB Analytical is required if the sample gas contains Cl₂, HCl, HF or other corrosive components.
- If the sample gas contains NH₃, FFKM75 gaskets must be used; in this case, the pneumatic module cannot be connected to the analyzer module.
- The pressure sensor must not be connected to the sample gas path during measurement of corrosive gases.

Flammable gases

- The analyzer module is suited for the measurement of flammable gases and vapors under atmospheric conditions ($p_{abs} \leq 1.1$ bar, oxygen content ≤ 21 vol.-%). Temperature class: T4.
- The sample gas may not be explosive in standard operation; If the sample gas is explosive in the event of a sample gas supply failure, then only seldom and briefly (in accordance with Zone 2).
- Before using the analyzer module, the corrosion resistance against the specific sample gas must be checked.
- The pressure sensor must not be connected to the sample gas path.
- Housing purge with nitrogen should be provided during measurement of flammable gases and vapors.

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Pressure sensor

Note - Pressure compensation with external pressure sensor

If the integration of an external pressure signal into the signal processing is required, this must be specified when ordering.

External pressure compensation is calculated using a function block.

Gas connections

Refer to **Gas connections** on page 20.

Oxygen analyzer Magnos27

Measuring principle

Paramagnetic behavior of oxygen
Heavy-duty thermomagnetic analyzer

Sample components and measurement ranges

Sample component

Oxygen (O₂) in flue gas or in nitrogen (N₂)

Smallest measuring range

0 to 3 vol.% O₂

Measuring range quantity and measuring range limits

1 to 4 measuring ranges
Ranges are factory-set in accordance with order.

Largest measuring range

0 to 100 vol.% O₂
Measuring ranges within ignition limits cannot be provided.

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They relate to the smallest measurement range.

Linearity error

≤ 2 % of span

Repeatability

≤ 1 % of measuring span

Zero point drift

≤ 1 % of span per week

Span drift

≤ 2 % of measured value per week

Output signal fluctuation (2 σ)

≤ 0.5 % of smallest measuring range span at electronic
T₉₀ time = 0 s

Detection limit (4 σ)

≤ 1 % of the measuring span of the smallest measuring range at electronic T₉₀ time = 0 s

Influences

Flow effect

≤ 1 % of span at a flow change of ±10 l/h. At an identical flow rate for test and sample gases, the flow rate effect is automatically compensated.

Associated gas effect

Magnos27 calibration applies only to the sample gas shown on the identification plate (= sample component + associated gas).

Temperature effect

Ambient temperature in permissible range

- At zero point:
≤ 2 % of span per 10 °C
- On the sensitivity:
≤ 0.5 % of the measured value per 10 °C based on temperature at the time of calibration
Thermostat temperature = 63 °C.

Air pressure effect

- at zero point:
< 0.05 vol. % O₂ per 1 % air pressure
- On sensitivity without pressure correction:
≤ 1.5 % of the measured value per 1 % of air pressure change
- On sensitivity with pressure correction using an integrated pressure sensor (option):
≤ 0.25 % of the measured value per 1 % of air pressure change
Option: calibration for operating altitude over 2000 m

Power supply effect

DC 24 V ± 5 %: ≤ 0.2 % of span

Position effect

Approx. 3 % of the span of the smallest measuring range per 1° deviation from horizontal orientation.
Position has no effect on the hard-mounted unit.

Dynamic response

Warm-up time

2 to 4 h

T₉₀ time

T₉₀ = 10 to 22 s, depending on sample gas flow and on the sample chamber connection (see **Gas connections** on page 22; applies to a gas analyzer only with Magnos27)

... Oxygen analyzer Magnos27

Calibration

Zero-point calibration

With oxygen-free process gas or substitute gas

End-point calibration

With process gas having a known oxygen concentration or with substitute gas

Materials

Analyzer

Stainless steel 1.4580 and 1.4305, glass

Gas lines and connectors

Stainless steel 1.4571 and 1.4305, PVC-C, FPM

Sample gas conditions

Sample gas inlet conditions

Magnos27 – sample gas input conditions

Temperature

- If the sample gas taken from the process is hotter than the coldest point in the sample gas path, there may be condensation at this point, if the gas contains components that can condense. Therefore, the sample gas dew point should be at least 5 °C below the lowest temperature throughout the sample gas path. Otherwise a sample gas cooler or condensate trap is an absolute requirement.
- When there is a direct connection to the sample chamber, the maximum sample gas dew point is 55 °C.
- Water vapor content variations cause volume errors.

Designation of gas connections

Internal pressure drop:	< 5 hPa at standard flow rate of 60 l/h.
Permissible absolute pressure range:	800 to 1250 hPa. Operation under lower absolute pressure (e.g. at altitudes above 2000 m) on request.
Gauge pressure in the measuring chamber:	max. 100 hPa.
Flow rate	20 to 90 l/h

Flammable gases

Measurement of flammable gases is not permitted.

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Gas connections

Refer to **Gas connections** on page 22.

Trace oxygen analyzer ZO23

Measuring principle

Potentiometric measurement

Zirconium dioxide cell for determination of the oxygen concentration in accordance with Nernst's equation; reference gas: ambient air.

The analyzer module is used for the continuous measurement of oxygen in pure gases (N₂, CO₂, Ar). The measuring cell is catalytically inactivated to the extent that flammable carrier components in stoichiometric concentrations only negligibly reduce the oxygen value.

Sample components and measurement ranges

Sample component

Oxygen (O₂)

Measuring ranges and measuring range limits

4 measurement ranges

The limits of the measuring ranges are freely adjustable within the range of 0 to 1 ppm to 0 to 250,000 ppm O₂; they are factory-set to 0 to 1/10/100/1000 ppm O₂. The following measurement data refer to a span of 100 ppm O₂ with a regulated flow rate of 8 ±0.2 l/h.

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They relate to the smallest measurement range.

Linearity

Owing to the measurement principle, zirconium dioxide cells are base linear.

Repeatability

< 1 % of the measuring span or 100 ppb O₂ (greater value applies)

Zero point drift

< 1 % of the measuring range per week or 250 ppb O₂ (greater value applies)

The zero point (reference point) is displayed if ambient air is present on the sample gas side.

The value for air of 20.6 vol. % O₂ (at 25 °C and 50 % relative air humidity) may deviate through aging of the cell.

Span drift

For pure gas measurements in N₂, CO₂ and Ar:

< 1 % of the measuring range per week or 250 ppb O₂ (greater value applies)

Depends on possible interfering components (catalyst poisons) in the sample gas and the aging of the cell.

Output signal fluctuation (2 σ)

< ±0.5 % of the measured value or 50 ppb O₂ (whichever is greater)

Detection limit (4 σ)

< ±1 % of the measured value or 100 ppb O₂ (whichever is greater)

... Trace oxygen analyzer Z023

Influences

Flow effect

≤ 300 ppbv O₂ in the range from 5 to 10 l/h

Associated gas effect

Inert gases (Ar, CO₂, N₂) have no effect.

Flammable gases (CO, H₂, CH₄) in stoichiometric concentrations to the oxygen content:

Conversion O₂ < 20 % of the stoichiometric turnover.

If higher concentrations of flammable gases are present, higher O₂ conversions must be expected. The sum of concentrations of flammable gases in the sample gas must not exceed 100 ppm.

Temperature effect

The effect of the ambient temperature in the permissible range of 5 to 45 °C is < 2 % of the measured value or 50 ppb O₂ per 10 °C change in the ambient temperature, whichever value is greater

Air pressure effect

No effect through a change in air pressure; sample gas must flow out of the outlet without back pressure.

Power supply effect

DC 24 V ± 5 %: no effect

Position effect

No position effect for permanently installed instruments

Dynamic response

Warm-up time

- The operating temperature of the cell is reached after approx. 15 minutes. Offset calibration with reference gas (ambient air) after 2 hours flow.
- The measurement is ready-to-run after valves and lines have been purged with sample gas. Typical purging time for valves and lines: approx. 2 to 5 hours.

T₉₀time

T₉₀ < 60 sec for the alternation of 2 test gases in the measuring range 10 ppm with a sample gas flow rate = 8 l/h and electronic T₉₀ time = 3 sec

Calibration

Offset calibration

The reference value for ambient air is calibrated at 20.6 vol.% O₂ by means of ambient air on the sample gas side.

End-point calibration

By means of test gas O₂ in N₂ (or in CO₂ or Ar);

O₂ concentration in the measuring range, e.g. 10 ppm O₂

Function test

Extended response time or reduced sensitivity are dimensions for the correct functioning of the measuring cell. The function test can be carried out without any additional test gases by feeding the sample gas with constant concentration.

Based on the progression of the test, it can be assessed whether the reaction time of the sensor lies within a specified tolerance. The function test is started manually and lasts approx. 15 minutes.

Additional function block configuration is required for the cyclic scan.

Materials

Analyzer

- Zirconium dioxide cell: ZrO₂, electrodes containing platinum
- Dust filter (optional): PP
- Flow sensor (optional): on semiconductor basis, nickel-plated brass

Gas lines and connectors

- Gas inlet (piped): Stainless steel 1.4571 (AISI 316Ti)
- Gas outlet: Silicone hose and FPM-hose
- Gas connections: Stainless steel 1.4401/1.4305

Sample gas conditions

Sample gas inlet conditions

Note

The analyzer module must not be used for measurement of ignitable gas/air or gas/oxygen mixtures.

ZO23 – sample gas input conditions

Temperature	5 to 50 °C
Inlet pressure	$p_e \leq 70$ hPa
Flow rate	4 to 20 l/h

- The sample gas flow rate must be kept constant within the specified range at ± 0.2 l/h.
- The sample gas must be taken unpressurized from a bypass.
- If the sample gas flow is too low, contamination effects from the gas lines (leaks, permeability, de-sorption) will lead to inaccuracies in the measurement result.
- If the sample gas flow is too high, asymmetrical cooling of the sensor may cause measurement errors. This can also cause quicker aging or damage to the measuring cell.

Note

The temperature, pressure and flow of the sample gas must be kept constant, to such an extent that the influence of variations on the measuring accuracy is acceptable, refer to **Influences** on page 24.

Corrosive gases

The presence of corrosive gases and catalyst poisons, such as halogens, gases containing sulfur and heavy-metal dust, leads to quicker aging and / or the destruction of the ZrO_2 cell.

Flammable gases

The analyzer module is suitable for measuring flammable gases in a non-explosive environment. The concentration of flammable gases in the sample gas must not exceed 100 ppm.

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Purge gas

If case purging is selected, purging may only be carried out with air (not with nitrogen), since the ambient air is used as a reference gas.

Note

The ZO23 cannot be connected to or combined with the pneumatic module.

Gas connections

Refer to **Gas connections** on page 25.

Thermal conductivity analyzer Caldos25

Measuring principle

Difference in thermal conductivity of various gases

Highly corrosion-resistant heat conductivity analyzer, measuring cell embedded in glass.

Sample components and measurement ranges

The Caldos25 is specifically designed for measurements of corrosive gas components.

Sample components and smallest measurement ranges (examples)		
Sample component and associated gas	Smallest measurement range	Reference gas
H ₂ in N ₂ or air	0 to 0.5 Vol.-%	Air (sealed)
SO ₂ in N ₂ or air	0 to 1.5 Vol.-%	Air (sealed)
H ₂ in Cl ₂	0 to 0.5 Vol.-%	Flowing

Measuring range quantity and measuring range limits

1 to 4 measuring ranges per sample component

The measuring ranges are factory-set in accordance with the customer order.

Largest measuring range

0 to 100 vol. % or 0 vol. % to saturation

Measurement ranges within ignition limits cannot be provided.

Measuring range switching ratio

≤ 1:20

Measuring ranges with suppressed zero point

Span at least 2 vol.%, depending on application

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They relate to the smallest measurement range.

Linearity error

≤ 2 % of span

Repeatability

≤ 1 % of span

Zero drift

≤ 1 % of span per week

Span drift

≤ 1 % of measured value per week

Output signal fluctuation (2 σ)

≤ 0.5 % of smallest measurement range span at electronic

T₉₀ time = 3 sec

Detection limit (4 σ)

≤ 1 % of smallest measurement range span at electronic

T₉₀ time = 3 sec

Influences

Flow effect

≤ 1 to 5 % of span at a flow change of ±10 l/h.

At an identical flow rate for test and sample gases, the flow rate effect is automatically compensated.

Associated gas effect

Analyzer calibration should be based on an analysis of the sample gas.

Measurement results can be greatly distorted by interfering components in complex (non-binary) gas mixtures.

Temperature effect

Ambient temperature in permissible range

- In any point of the measuring range:
≤ 1 % of span per 10 °C, based on the temperature at the time of calibration

Thermostat temperature = 60 °C (140 °F)

Air pressure effect

No effect in permissible operating condition range

Power supply effect

DC 24 V ± 5 %: ≤ 0.2 % of span

Position effect

< 1 % of span up to 10° deviation from horizontal orientation

Dynamic response

Warm-up time

1.5 hours

T₉₀time

T₉₀ typical = 10 to 20 s; optional: T₉₀ < 6 s

(applies to an analyzer unit with 1 analyzer module)

Calibration

Calibration	Test gas
Zero-point calibration	Sample-component-free process gas or substitute gas With suppressed measuring range: Substitute gas or operating gas with sample gas concentration close to the starting point of the measuring range
End-point calibration	Test gas, process gas with a known sample gas concentration or substitute gas

... Thermal conductivity analyzer Caldos25

Materials

Analyzer

Stainless steel 1.4305 (AISI 303), glass

Gas lines and connectors

- If the reference gas is sealed:
Stainless steel 1.4305;
- If the reference gas is flowing:
PVC-C, FPM gaskets;
- For corrosive measurement gas:
PVC-C, FPM gaskets;

Contains the NH₃ sample gas, therefore FFKM gaskets are used.

Sample gas conditions

Sample gas inlet conditions

Caldos25 – sample gas input conditions

Temperature

- If the sample gas taken from the process is hotter than the coldest point in the sample gas path, there may be condensation at this point, if the gas contains components that can condense. The sample gas dew point should be at least 5 °C below the temperature throughout the sample gas path. Otherwise a sample gas cooler or condensate trap is required.
- Water vapor content variations cause volume errors.

Designation of gas connections

Internal pressure drop:	< 5 hPa at standard flow rate of 60 l/h.
Permissible absolute pressure range:	800 to 1250 hPa. Operation under lower absolute pressure (e.g. at altitudes above 2000 m) on request.
Gauge pressure in the measuring chamber:	max. 100 hPa.
Flow rate	Standard 10 to 90 l/h, Max. 90 to 200 l/h for option T ₉₀ < 6 s

Flowing reference gas

Gas inlet conditions same as sample gas

Flammable gases

- The analyzer module is suited for the measurement of flammable gases and vapors under atmospheric conditions ($p_{abs} \leq 1.1$ bar, oxygen content ≤ 21 vol.%). Temperature class: T4.
- The sample gas may not be explosive in standard operation; If the sample gas is explosive in the event of a sample gas supply failure, then only seldom and briefly (in accordance with Zone 2).
- Pressure in the sample gas path in standard operation $p_e \leq 100$ hPa; in case of a sample gas supply failure the pressure must not up-scale the maximum value $p_e = 500$ hPa.
- Before using the analyzer module, the corrosion resistance against the specific sample gas must be checked.
- The pressure sensor must not be connected to the sample gas path.
- Housing purge with nitrogen should be provided during measurement of flammable gases and vapors. Flame barriers can be used as an option (except for the ‘safety concept’ version, see **Version in category II 3G for measurement of flammable and non-flammable gases (‘Safety Concept’)** on page 59).

Flame barriers

Pressure drop	Approx. 40 hPa at a sample gas flow rate of 50 l/h
Material	Stainless steel 1.4571

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Gas connections

Refer to **Gas connections** on page 28.

Sample components and measurement ranges for monitoring hydrogen-cooled turbo generators

Sample component and associated gas	Meas. range
CO ₂ in air	0 to 100 Vol.-%
H ₂ in CO ₂	100 to 0 Vol.-%
H ₂ in air	100 to 80/90 vol.-%

Other sample components on request.

Measuring range quantity and measuring range limits

1 to 4 measuring ranges per sample component

Range limits are freely adjustable. They are factory-calibrated for the largest possible measurement range.

Largest measuring range

0 to 100 vol. % or 0 vol. % to saturation, depending on measurement task.

Measurement ranges within ignition limits cannot be provided.

Measuring range switching ratio

≤ 1:20

Measuring ranges with suppressed zero point

See the table above for spans

... Thermal conductivity analyzer Caldos27

Stability

These data apply only to measuring ranges $\geq$ class 2

Linearity error

$\leq 2\%$ of span

Repeatability

$\leq 1\%$ of span

Zero drift

$\leq 2\%$ of smallest possible measuring range per week

Span drift

$\leq 0.5\%$ of the smallest provided measuring range per week

Output signal fluctuation (2σ)

$\leq 0.5\%$ of smallest measurement range span at electronic
T₉₀ time = 3 sec

Detection limit (4σ)

$\leq 1\%$ of smallest measurement range span at electronic
T₉₀ time = 3 sec

Influences

Flow effect

$\leq 0.5\%$ of span at a flow change of ± 10 l/h. At an identical flow rate for test and sample gases, the flow rate effect is automatically compensated.

Associated gas effect

Analyzer calibration should be based on an analysis of the sample gas.

Temperature effect

Ambient temperature in permissible range.

At each point in the measuring range:

$\leq 0.5\%$ of the measuring span per 10°C , with respect to the temperature during calibration

Thermostat temperature = 60°C (140°F)

Air pressure effect

$\leq 0.25\%$ of span per 10 hPa for the smallest ranges; for larger spans, the influence effect is correspondingly lower.

Power Supply Influence Calibration for operating altitude over 2000 m

Power supply effect

24 V DC $\pm 5\%$: $\leq 0.2\%$ of span

Position effect

$< 1\%$ of span up to 30° deviation from horizontal orientation

Dynamic response

Warm-up time

Approx. 30/60 minutes for class 1/2 measuring ranges

T₉₀ time

T₉₀ ≤ 2 s for direct sample chamber connection and sample gas flow = 60 l/h (applies to an analyzer unit with 1 analyzer module)

Calibration

Calibration	Test gas
Zero-point calibration	Sample-component-free process gas or substitute gas With suppressed measuring range: Substitute gas or operating gas with sample gas concentration close to the starting point of the measuring range
End-point calibration	Test gas, process gas with a known sample gas concentration or substitute gas
Single-point calibration with standard gas	Test gas with a known and constant rTC value or substitute gas (standard gas; possibly also dried room air)

Materials

Analyzer

- Sample chamber: Stainless steel 1.4305 (AISI 316Ti)
- Sensor: Gold, silicon oxo-nitride
- Gasket: FFKM75 (Perfluoro rubber)

Sample gas conditions

Sample gas inlet conditions

Note

The analyzer module must not be used for measurement of ignitable gas/air or gas/oxygen mixtures.

Caldos27 – sample gas input conditions

Temperature

- If the sample gas taken from the process is hotter than the coldest point in the sample gas path, there may be condensation at this point, if the gas contains components that can condense. Therefore, the sample gas dew point should be at least 5 °C below the lowest temperature throughout the sample gas path. Otherwise a sample gas cooler or condensate trap is an absolute requirement.
- Water vapor content variations cause volume errors

Designation of gas connections

Internal pressure < 5 hPa at standard flow rate of 60 l/h.
drop:

Permissible absolute 800 to 1250 hPa

pressure range: Operation under lower absolute pressure (e.g. at altitudes above 2000 m) on request

Gauge pressure in the max. 100 hPa

measuring chamber:

Flow rate Typically 10 to 90 l/h,
minimum 1 l/h

Corrosive gases

- Consultation with ABB Analytical is required if the sample gas contains Cl₂, HCl, HF, SO₂, NH₃, H₂S or other corrosive components.
- If the sample gas contains NH₃, flexible FPM tubes may not be used; flexible FFKM tubes must be used instead.

In this case, the pneumatics module cannot be connected to the analyzer module.

... Thermal conductivity analyzer Caldos27

... Sample gas conditions

Flammable gases

- The analyzer module is suited for the measurement of flammable gases and vapors under atmospheric conditions ($p_{abs} \leq 1.1$ bar, oxygen content ≤ 21 vol.%). Temperature class: T4.
- The sample gas may not be explosive in standard operation; If the sample gas is explosive in the event of a sample gas supply failure, then only seldom and briefly (in accordance with Zone 2).
- Pressure in the sample gas path in standard operation $p_e \leq 100$ hPa; in case of a sample gas supply failure the pressure must not up-scale the maximum value $p_e = 500$ hPa.
- Before using the analyzer module, the corrosion resistance against the specific sample gas must be checked.
- The pressure sensor must not be connected to the sample gas path.
- Housing purge with nitrogen should be provided during measurement of flammable gases and vapors. Flame barriers can be used as an option (except for the ‘safety concept’ version, see **Version in category II 3G for measurement of flammable and non-flammable gases (‘Safety Concept’)** on page 59).

Flame barriers	
Pressure drop	Approx. 40 hPa at a sample gas flow rate of 50 l/h
Material	Stainless steel 1.4571

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Gas connections

Refer to **Gas connections** on page 32.

FID analyzer Fidas24

Measuring principle

Flame-ionization detector

The analyzer module complies with the requirements for measuring instruments with flame ionization detection according to EN 12619.

Sample components and measurement ranges

Sample components

Hydrocarbons.

The concentration of the gas components in the sample gas path must not exceed the temperature-dependent LEL. The analyzer temperature is 180 °C.

Number of sample components

4 sample components

Smallest measuring range

0 to 5 to 0 to 1500 mg org. C/m³ or
0 to 10 to 0 to 3000 ppm C1

Largest measuring range

0 to 80 g org. C/m³ or 0 to 15 vol. % C1
Other measuring ranges on request.

Measuring range quantity and measuring range limits

1 to 4 measuring ranges

The measuring ranges are factory-set per customer order. Smallest to largest measuring range ratio 1:300 to 1:1500, depending on the configuration.

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They relate to the smallest measurement range.

They apply to measuring ranges ≥ 50 mg org. C/m³; for smaller measuring ranges these only apply if they are factory-set in accordance with the order.

Linearity error

≤ 2 % of span to 5000 mg org. C/m³,
this value applies in one (calibrated) measuring range

Repeatability

≤ 0.5 % of measurement range

Zero drift

≤ 0.5 mg org. C/m³ per week

Span drift

≤ 0.5 mg org. C/m³ per week

Output fluctuation at zero point (2 σ)

≤ 0.5 % of span at electronic T₉₀-time = 20 s

Detection limit (4 σ)

≤ 1 % of span at electronic T₉₀ time = 20 s

... FID analyzer Fidas24

Influences

Oxygen dependence

- ≤ 2 % of measured value for 0 to 21 vol. % O₂ or
- ≤ 0.3 mg org. C/m³, the larger value applies in each case

Temperature effect

Ambient temperature in permissible range

- At zero point and on sensitivity:
≤ 2 % of the measured value per 10 °C or ≤ 300 ppb C1 per 10 °C

Power supply effect

- DC 24 V ± 5 %: ≤ 0.2 % of span or
- AC 230 V ± 10 %: ≤ 0.2 % of span or
- AC 115 V ± 10 %: ≤ 0.2 % of span

Dynamic response

Warm-up time

≤ 2 hours

T₉₀time

T₉₀ < 1.5 s at sample gas flow = 80 l/h and electronic
T₉₀time = 1 sec

Calibration

Calibration	Test gas
Zero-point calibration	With synthetic air or catalytically purified air or nitrogen, depending on the application.
End-point calibration	With propane or another hydrocarbon (substitute gas) in air or nitrogen, depending on the application.

Materials

Analyzer, gas lines and connectors

Stainless steel 1.4305 and 1.4571, FPM, PTFE, FFKM

Sample gas conditions

Sample gas inlet conditions

Fidas24 – sample gas input conditions

Temperature	≤ Thermostat temperature (thermostat temperature for sample gas path, detector and air injector ≤ 200 °C, factory-set at 180 °C)
Inlet pressure	p _{abs} = 800 to 1100 hPa
Flow rate	approx. 80 to 100 l/h at atmospheric pressure (1000 hPa)
Humidity	≤ 40 % H ₂ O

Further properties of the sample gas

The sample gas must not be explosive at any time.

The analyzer module must not be used for the measurement of gases containing organometallic compounds, e.g. lead-containing fuel additives or silicone oils.

Flammable gases

The gas analyzer may be used for the measurement of flammable gases provided that the flammable portion does not up-scale 15 Vol.-% CH₄ or does not up-scale C1 equivalents.

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Operational gases

Instrument air

Parameter	Value/Description
Quality	According to ISO 8573-1 Class 2 Particle size: max. 1 µm, Particle density: max. 1 mg/m ³ , Oil content: max. 0.1 mg/m ³ , Dew point: At least 10 °C below the lowest expected ambient temperature
Inlet pressure p _e	4000 hPa, ±500 hPa
Flow rate	Typically approx. 1800 l/h (1200 l/h for the air jet injector and approx. 600 l/h for the housing purge), max. approx. 2200 l/h (1500 l/h + 700 l/h)

Combustion air

Parameter	Value/Description
Quality	- Synthetic air or catalytically purified air - Organic hydrocarbon content: < 1 % of the measuring range
Inlet pressure p _e	1200 hPa, ±100 hPa
Flow rate	< 20 l/h

Combustion gas

Note

An H₂/He mixture may only be used if the gas analyzer has been ordered and delivered in the intended version.

Combustion gas parameter		
Quality	Hydrogen (H ₂), Quality 5.0	H ₂ /He mix (40 %/60 %) Quality 5.0
Inlet pressure p _e	1200 hPa, ±100 hPa	1200 hPa, ±100 hPa
Maximum combustion gas flow	approx. 3 l/h	approx. 10 l/h

Note

A flow limiter must be provided on the hydrogen supply, see **Safe operation of the gas analyzer** on page 36.

Test gases

Test Gases for Zero Calibration	
Quality	Nitrogen, Quality 5.0, synthetic air or catalytically cleaned air with an organic C < 1 % MBU
Inlet pressure p _e	1000 ±100 hPa
Flow rate	130 to 250 l/h

Test gases for endpoint calibration	
Quality	Test gas in nitrogen or synthetic air with concentration adjusted to the measuring range
Inlet pressure p _e	1000 ±100 hPa
Flow rate	130 to 250 l/h

Zero point offset

If the zero point gas is not completely free of hydrocarbons (even purified nitrogen contains fractions of hydrocarbons), negative measured values may be displayed in small measuring ranges.

In this case, the sample gas contains a lower proportion of hydrocarbons than the zero point gas.

Gas and Electrical Connections

Refer to **Fidas24** on page 81.

... FID analyzer Fidas24

Safe operation of the gas analyzer

The device concept ensures that a concentration of combustible gas or an explosive mixture of combustible gas and ambient air cannot occur in the interior of the gas analyzer during normal operation.

The interior of the gas analyzer cannot be allocated to an (explosion protection) zone; an explosive gas mixture cannot escape to the outside.

The end user must make the following provisions to ensure safe operation of the gas analyzer:

- The combustion gas flow rate must be limited to a maximum of 10 l/h H₂ or 25 l/h H₂/He mixture. For this purpose, the end user has to provide suitable measures outside the gas analyzer.
- A shut-off valve must be installed in the combustion gas supply line to increase safety in the following operating conditions: shutting down the gas analyzer, failure of the instrument air supply, leakage in the combustion gas feed path inside the gas analyzer. This shut-off valve should be installed outside the analyzer house near the combustion gas supply.

FID analyzer Fidas24 NMHC

Measuring principle

Non-methane flame-ionization detector
(NMHC = Non-Methane Hydrocarbons)

The analyzer module complies with the requirements for measuring instruments with flame ionization detection according to EN 12619.

A non-methane converter is used in the Fidas24 NMHC to measure CH₄.

Sample components and measurement ranges

Sample components

Hydrocarbons.

The CH₄/NMHC ratio must be in the 1:9 to 9:1 range.

- Maximum concentration CH₄:
26500 mg org. C/m³ or 50000 ppm C1.
- Maximum concentration NMHC:
5000 mg org. C/m³ or 9330 ppm C1.

The concentration of the gas components in the sample gas path must not exceed the temperature-dependent LEL. The analyzer temperature is 180 °C.

Number of sample components

2 sample components: CH₄ and THC.

The calculated non-methane portion of the hydrocarbons is output as the 3rd NMHC component.

Smallest measuring range

0 to 5 to 0 to 1500 mg org. C/m³ or
0 to 10 to 0 to 3000 ppm C1

Largest measuring range CH₄ and THC

0 to 50 to 0 to 25000 mg org. C/m³ or
0 to 100 to 0 to 50000 ppm C1

Largest measuring range NMHC

0 to 5000 mg org. C/m³ or
0 to 10000 ppm C1

Measuring range quantity and measuring range limits

1 to 4 measuring ranges

The measuring ranges are factory-set per customer order.

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They relate to the smallest measurement range.

They apply to measuring ranges ≥ 50 mg org. C/m³; for smaller measuring ranges these only apply if they are factory-set in accordance with the order.

Linearity error

≤ 2 % of span to 5000 mg org. C/m³,
this value applies in one (calibrated) measuring range

Repeatability

≤ 0.5 % of measurement range

Zero drift

≤ 0.5 mg org. C/m³ per week

Span drift

≤ 0.5 mg org. C/m³ per week

Output fluctuation at zero point (2 σ)

≤ 0.5 % of span at electronic T₉₀-time = 20 s

Detection limit (4 σ)

≤ 1 % of span at electronic T₉₀ time = 20 s

... FID analyzer Fidas24 NMHC

Influences

Oxygen dependence

- ≤ 2 % of measured value for 0 to 21 vol. % O₂ or
- ≤ 0.3 mg org. C/m³, the larger value applies in each case

Temperature effect

Ambient temperature in permissible range

- At zero point and on sensitivity:
 - ≤ 2 % of the measured value per 10 °C or ≤ 300 ppb C1 per 10 °C

Power supply effect

- DC 24 V ± 5 %: ≤ 0.2 % of span or
- AC 230 V ± 10 %: ≤ 0.2 % of span or
- AC 115 V ± 10 %: ≤ 0.2 % of span

Dynamic response

Warm-up time

≤ 2 hours

T₉₀ time

T₉₀ < 2.5 s via bypass, T₉₀ < 3 s via converter at sample gas flow = 80 l/h and electronic T₉₀ time = 1 s

Switchover time

Between bypass and converter typically 20 s, depending on measuring range

Converter operating time

The catalyst is a consumable material.

Its service life depends on the concentration of the converted hydrocarbons.

Catalyst poisons (e.g. SO₂, HCl, H₂S, halogenated hydrocarbons, heavy metals) will shorten the converter service life. Their respective concentration should always be < 20 mg/m³.

It is recommended to test the converter function once a year.

Calibration

Zero-point calibration

With synthetic air or catalytically purified air, depending on application

Sensitivity calibration

With methane or propane in air, depending on application

Materials

Analyzer, gas lines and connectors

Stainless steel 1.4305 and 1.4571, FPM, PTFE, FFKM

Sample gas conditions

Sample gas inlet conditions

Fidas24 – sample gas input conditions

Safe operation of the gas analyzer

The device concept ensures that a concentration of combustible gas or an explosive mixture of combustible gas and ambient air cannot occur in the interior of the gas analyzer during normal operation.

The interior of the gas analyzer cannot be allocated to an (explosion protection) zone; an explosive gas mixture cannot escape to the outside.

The end user must make the following provisions to ensure safe operation of the gas analyzer:

- The combustion gas flow rate must be limited to a maximum of 10 l/h H₂ or 25 l/h H₂/He mixture. For this purpose, the end user has to provide suitable measures outside the gas analyzer.
- A shut-off valve must be installed in the combustion gas supply line to increase safety in the following operating conditions: shutting down the gas analyzer, failure of the instrument air supply, leakage in the combustion gas feed path inside the gas analyzer. This shut-off valve should be installed outside the analyzer house near the combustion gas supply.

AO2040-Fidas24 Ex for use in Zone 1, 21 und Zone 2, 22

The AO2040-Fidas24 Ex is an explosion proof variant of the Fidas24 analyzer module from the Advance Optima AO2000 series. The AO2040-Fidas24 Ex is a standalone variant of the AO2000.

The device consists of the following modules:

- Analyzer module Fidas24
- Electronics module with system controller and I/O modules
- Wall housing with display and control unit and attached purge and monitoring unit.

Explosion protection

The AO2040-Fidas24 Ex is available in the following variants:

- Equipment protection level EPL Gb for use in Zone 1
- Equipment protection level EPL Db for use in Zone 21
- Equipment protection level EPL Gc for use in Zone 2
- Equipment protection level EPL Dc for use in Zone 22

In all variants, the protection concept is based on a pressurized enclosure in accordance with EN 60079-2 and an intrinsically safe control unit in accordance with EN 60079-11. For the Zone 1 and Zone 21 variants, the customer interfaces must be protected with an all-pole isolating relay.

Measuring principle

Flame-ionization detector

The analyzer module complies with the requirements for measuring instruments with flame ionization detection according to EN 12619.

Sample components and measurement ranges

Sample components

Hydrocarbons.

The concentration of the gas components in the sample gas path must not exceed the temperature-dependent LEL. The analyzer temperature is 180 °C.

Number of sample components

4 sample components

Smallest measuring range

0 to 5 to 0 to 1500 mg org. C/m³ or
0 to 10 to 0 to 3000 ppm C1

Largest measuring range

0 to 80 g org. C/m³ or 0 to 15 vol. % C1
Other measuring ranges on request.

Measuring range quantity and measuring range limits

1 to 4 measuring ranges

The measuring ranges are factory-set per customer order. Smallest to largest measuring range ratio 1:300 to 1:1500, depending on the configuration.

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They relate to the smallest measurement range.

They apply to measuring ranges ≥ 50 mg org. C/m³; for smaller measuring ranges these only apply if they are factory-set in accordance with the order.

Linearity error

≤ 2 % of span to 5000 mg org. C/m³, this value applies in one (calibrated) measuring range

Repeatability

≤ 0.5 % of measurement range

Zero drift

≤ 0.5 mg org. C/m³ per week

Span drift

≤ 0.5 mg org. C/m³ per week

Output fluctuation at zero point (2 σ)

≤ 0.5 % of span at electronic T₉₀-time = 20 s

Detection limit (4 σ)

≤ 1 % of span at electronic T₉₀-time = 20 s

Influences

Oxygen dependence

- ≤ 2 % of measured value for 0 to 21 vol. % O₂ or
- ≤ 0.3 mg org. C/m³, the larger value applies in each case

Temperature effect

- Ambient temperature in permitted range:
 - Standard: 5 to 45 °C
 - Measuring ranges < 100 ppm: 5 to 40 °C
- At zero point and on the sensitivity:
 - < 2 % of the measured value per 10 K or < 300 ppb C₁ per 10 K, the larger value shall respectively apply

Power supply effect

- DC 24 V ±5 %:
 - ≤ 0.2 % of span or
- AC 230 / 115 V ±10 %:
 - ≤ 0.2 % of span

Dynamic response

Warm-up time

≤ 2 h at nominal voltage and 25 °C ambient temperature

T₉₀ < 1.5 s at sample gas flow = 80 l/h and electronic
T₉₀time = 1 s

Calibration

Calibration	Test gas
Zero-point calibration	With synthetic air or catalytically purified air or nitrogen, depending on the application.
End-point calibration	With propane or another hydrocarbon (substitute gas) in air or nitrogen, depending on the application.

Materials

Analyzer, gas lines and connectors

Stainless steel 1.4305 and 1.4571, FPM, PTFE, FFKM

Sample gas conditions

Sample gas inlet conditions

Parameter	Value/Description
Temperature	≤ 130 °C (also applies in the case of heated sample gas lines)
Inlet pressure p _{abs}	800 to 1100 hPa
Outlet pressure	The outlet pressure must be the same as the atmospheric pressure. Overpressure version: maximum 1250 hPa abs
Flow rate	Approx. 80 to 100 l/h at atmospheric pressure (1000 hPa)
Humidity	≤ 40 % H ₂ O

Note

The temperature, pressure and flow of the sample gas must be kept constant, to such an extent that the influence of variations on the measuring accuracy is acceptable, refer to **Stability** on page 42.

Further properties of the sample gas

The sample gas must not be explosive at any time.

The analyzer module must not be used for the measurement of gases containing organometallic compounds, e.g. lead-containing fuel additives or silicone oils.

... AO2040-Fidas24 Ex for use in Zone 1, 21 und Zone 2, 22

... Sample gas conditions

Flammable sample gases

DANGER

Explosion hazard

Explosion hazards due to flammable sample gases with a C1-equivalent of ≥ 8 Vol-% CH_4 .

- The flammable sample gas that is fed in must have the following specifications:

Sample gas specifications

- The sample gas that is fed in must at no time, exceed the C1-equivalent of 8 Vol-% CH_4 .
- The sample gas that is fed in must not be potentially explosive.
- The specifications must also be adhered to during the start-up and shut-down processes, and the pressure, temperature and gas matrix must be taken into account.

Note

An explosive mixture of gases is defined as a mixture containing combustion components, that falls within the lower (UEG) and upper explosion limits (OEG), which is accompanied by the simultaneous presence of oxidizers (e.g. air, oxygen).

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Operational gases

Properties of the instrument air

Parameter	Value/Description
Quality	According to ISO 8573-1 Class 2 Particle size: max. 1 μm , Particle density: max. 1 mg/m^3 , Oil content: max. 0.1 mg/m^3 , Dew point: At least 10 °C below the lowest expected ambient temperature
Inlet pressure p_e	4000 hPa, ± 500 hPa; 5000 hPa, ± 500 hPa for overpressure version
Temperature	Maximum 40 °C
Flow rate	Typically approx. 1200 l/h, refer also to Purge gas flow.

Note

For Fidas24-Ex in the overpressure version, the purge gas supply for the pressurized enclosure must be made separately from the instrument air supply. In the case of common supply, the pressure for the purge gas supply must be reduced using an additional pressure reducer.

Purging gas properties for pressurized enclosure (FS870S)

(in the case of separate supply)

Parameter	Value/Description
Quality	Class 533, in accordance with DIN ISO 8573-1
Inlet pressure p_e	4000 hPa, ± 500 hPa
Temperature	Maximum 40 °C
Flow rate	Refer to Purge gas flow.

Note

When using the instrument air of the Fidas24 as purging gas for the pressurized enclosure, the quality specified in the top table applies.

Combustion air

Parameter	Value/Description
Quality	- Synthetic air or catalytically purified air - Organic hydrocarbon content: < 1 % of the measuring range
Inlet pressure p_e	1200 hPa, ± 100 hPa
Flow rate	< 20 l/h

Combustion gas

Combustion gas parameter	
Quality	Hydrogen (H ₂), Quality 5.0
Inlet pressure p _e	1200 hPa, ±100 hPa
Combustion gas flow rate*	Typical ≤ 3 l/h, maximum 10 l/h

* The combustion gas flow is limited to a maximum of 10 l/h H₂ by an integrated flow limiter.

Note

The safety valve installed in the analyzer closes safely up to a combustion gas pressure of 6 bar.

The operator must take suitable measures to prevent the occurrence of higher pressures at the combustion gas inlet.

Test gases

Test Gases for Zero Calibration	
Quality	- Nitrogen, quality 5.0; synthetic or catalytically purified air - Organic hydrocarbon content of < 1 % of the measuring range
Inlet pressure p _e	1000 ± 100 hPa
Flow rate	130 to 250 l/h

Test gases for endpoint calibration	
Quality	Sample component or substitute gas component in nitrogen or synthetic air with concentration adjusted to the measuring range
Inlet pressure p _e	1000 ± 100 hPa
Flow rate	130 to 250 l/h

Purge gas flow

Initial purge

The purging gas flow rate and the duration of the purging process for the purging and monitoring unit FS870S are preset at the factory.

Parameter	Factory setting
Initial purge volumes	250 l
Purging gas flow rate during initial purging	3600 l/h (1 l/s)

During operation

The purging gas flow rate and the pressurized control range of the purging and monitoring unit FS870S are pre-programmed at the factory.

Parameter	Factory setting
Purge Gas Flow Rate during Operation	1080 l/h
Monitored pressurized control range	0.8 to 15 hPa

Gas and Electrical Connections

Refer to **Fidas24 Ex** on page 82.

Electrical data for the power supply

The power supply unit built into the system housing is used to supply the 24 V DC to the Fidas24 Ex module and the associated electronics with DC energy.

Power supply (entire device)	
Input voltage	110 to 230 V AC, ±10 %
Input Current	Maximum 2.0 A
Line Frequency Range	50 to 60 Hz, ±3 Hz
Power consumption (entire device)	Maximum 200 VA
Output Voltage	24 V DC, ±3 % (for optional cut-off relay control)
Connection	At the corresponding terminals of the purging and monitoring unit, refer to Purging and monitoring unit FS870S on page 86.

Battery

Application

Supply to the built-in clock in case of a voltage failure.

Type

Lithium button cell 3 V CR 2032

Note

Only the original battery type may be used as a replacement:

- Varta CR 2032 type no. 6032 or
- Renata type no. CR2032 MFR

... AO2040-Fidas24 Ex for use in Zone 1, 21 und Zone 2, 22

Safe operation of the gas analyzer

The device concept ensures that a concentration of combustible gas or an explosive mixture of combustible gas and ambient air cannot occur in the interior of the gas analyzer during normal operation.

The interior of the gas analyzer cannot be allocated to an (explosion protection) zone; an explosive gas mixture cannot escape to the outside.

The end user must make the following provisions to ensure safe operation of the gas analyzer:

- The maximum permissible combustible gas inlet pressure must not be up-scaled, see **Combustion gas** on page 45.
- A shut-off valve must be installed in the combustion gas supply line to increase safety in the following operating conditions: shutting down the gas analyzer, failure of the instrument air supply, leakage in the combustion gas feed path inside the gas analyzer. This shut-off valve should be installed outside the analyzer house near the combustion gas supply.

Housing design

The housing is designed as a wall unit (model AO2040) with housing protection IP 65.

Housing materials

- Housing: Stainless steel 1.4016 (AISI 316Ti)
- Module back panel: Aluminum
- Keyboard foil: Polyester

Housing color

Light gray (RAL 7035), basalt gray (RAL 7012)

Weight

Wall-mounted housing with analyzer module:
18 to 23 kg

Dimensions

Refer to **Model AO2040-Fidas24 Ex** on page 86.

Laser analyzer LS25

Overview

Figure 1: AO2000-LS25

The LS25 is an external AO2000 laser analyzer module for an in situ or cross-stack application directly on site in the process, additional gas extraction and gas conditioning systems are therefore not necessary. This improves the availability of measurements and eliminates the risk of sample handling failure. The analyzer is mounted directly on flanges, purge gas connections and a tilting mechanism for easy alignment are included in the purge flange.

Rough process conditions are not a problem for the LS25, so measurements are possible, for example, under high process temperatures, high process pressures, high dust exposure and even with corrosive gases. Thanks to the tunable diode laser absorption spectroscopy (TDLAS), a non-contact optical measurement method, the analyzer remains unaffected by impurities and corrosive substances and therefore does not need regular maintenance.

Continuous purging of the optical windows prevents dust and other impurities from settling and the measuring gas from coming into contact with the optical windows. Measurement as an extractive system with an external measuring cell is of course also possible.

Highlights	Typical applications	Customer benefits
Line measurement over the complete measuring distance	Metal industry	In situ measurement
Fast reaction time	Power plants	fast process optimization
contactless measurement	Waste incineration plants	proven technology
No interference with associated gases	Chemical industry	Low maintenance costs
no zero point drift	Petrochemical industry	Reduction of emissions into the environment
Available for tough process conditions	Cement industry	Increased safety
ATEX, IECEx and CSA certified	Pulp & Paper Industry	Increased system availability

Measuring principle

The LS25 laser analyzer module is based on a measuring principle called single-line spectroscopy. One single target gas absorption line with no interference is chosen in the near infrared spectral range.

A single mode diode laser operating around room temperature scans the respective absorption line. The absorption caused by the sample gas is measured by means of a receiver located opposite, and the concentration is determined based on this. An automatic correction of pressure and temperature changes is possible.

Sample components and measurement ranges

The LS25 laser analyzer module has one physical measurement range per sample component. The indicated measurement range can be freely calibrated within the physical measurement range. The smallest detection limits and corresponding measuring ranges are shown in the table below. Other sample components on request.

The optical path length is typically between 0.5 and 15.0 m. Application-related deviations can occur. In some cases, additional measures must be taken to achieve the smallest measuring ranges: The measurement of low O₂ and H₂O concentrations require device and process purging with nitrogen. Actual detection limit for a specific application will depend on the process conditions (pressure, temperature and gas composition) and optical path length. There are different device versions with different detection limits and process conditions for certain sample components. Min. measurement range, max. pressure and max. temperature cannot necessarily be realized simultaneously. The maximum pressure and temperature given are physical (spectroscopic) limits. Applications with increased temperature or pressure or with corrosive or flammable gas may require additional equipment.

... Laser analyzer LS25

... Sample components and measurement ranges

Sample components and measurement ranges

Other sample components and higher pressures on request.

Sample components*	Smallest measurement range	Max. abs. Pressure	Max. temperature
O ₂	0 to 1 vol.%	10 bar	1500 °C
NH ₃	0 to 15 ppm	2 bar	500 °C
HCl	0 to 5 ppm	2 bar	600 °C
HF	0 to 2 ppm	2 bar	400 °C
H ₂ S	0 to 300 ppm	2 bar	300 °C
H ₂ O (ppm)	0 to 10 ppm	2 bar	1000 °C
H ₂ O (vol.%)	0 to 0.5 vol.%	2 bar	1500 °C
CO (ppm)	0 to 30 ppm	2 bar	1500 °C
CO (vol.%)	0 to 0.3 vol.%	2 bar	1500 °C
CO ₂ (ppm)	0 to 100 ppm	2 bar	300 °C
CO ₂ (vol.%)	0 to 1 vol.%	2 bar	1500 °C
NO	0 to 1000 ppm	2 bar	350 °C
N ₂ O	0 to 100 ppm	2 bar	200 °C
NO ₂	0 to 500 ppm	2 bar	200 °C
HCN	0 to 30 ppm	2 bar	300 °C
CH ₃ I	0 to 100 ppm	1.5 bar	200 °C
CH ₄ (vol.%)	0 to 1 vol.%	3 bar	1000 °C
CH ₄ (ppm)	0 to 20 ppm	3 bar	300 °C
CH ₂ O	0 to 100 ppm	2 bar	200 °C
C ₂ H ₄	0 to 100 ppm	1.5 bar	150 °C
C ₂ H ₄ O	0 to 100 ppm	1.5 bar	150 °C
NH ₃ + H ₂ O	0 to 20 ppm 0 to 5 Vol.-%	1.5 bar	600 °C
HCl + H ₂ O	0 to 10 ppm 0 to 10 Vol.-%	1.5 bar	600 °C
HF + H ₂ O	0 to 3 ppm 0 to 2 Vol.-%	1.5 bar	400 °C
HCN + NH ₃	0 to 30 ppm 0 to 300 ppm	2 bar	300 °C
CO (vol.%) + CO ₂ (vol.%)	0 to 1 Vol.-% 0 to 1 Vol.-%	1.5 bar	600 °C
HCl + CH ₄	0 to 300 ppm 0 to 0.2 Vol.-%	1.5 bar	200 °C
CO (ppm) + CH ₄	0 to 20 ppm 0 to 200 ppm	1.5 bar	1500 °C
CO (ppm) + H ₂ O (vol.%)	0 to 300 ppm 0 to 10 Vol.-%	1.5 bar	1500 °C
O ₂ + Temp.	0 to 1 vol.-% 0 to 100 °C	2.0 bar	1500 °C

Note

The specified data are based on a 1 m optical path length, 25 °C sample gas temperature and a sample gas pressure of 1 bar abs., sample gas in nitrogen with a confidence level of 95 %, deviations from this are possible depending on the process.

Number of measuring ranges

1 range per sample component, 1 x transmission

Largest measuring range

Largest measuring range is generally 100 times the minimum measuring range for the same conditions. Larger measuring ranges are possible, for example by adjusting the optical path length or choosing a different absorption line, please contact ABB in this regard.

Sample gas properties

Maximum process gas temperature and pressure are given in the **Sample components and measurement ranges** on page 55 table.

Quantification of dust/particle concentration in the sample gas is necessary in order to determine max OPL. The maximum dust concentration must be checked by ABB Analytical.

Purge gas properties

The purge gas (instrument air or nitrogen, depending on the process) must be free of oil and dust.

Recommendation: in accordance with ISO 8573.1 Class 2–3

The process purging gas flow is between 10 and 50 l/min, depending on the application.

The analyzer purging gas flow (Ex pxb – Zone 1 devices) must be at least 11 l/min or 48 l/min.

Stability

Linearity error

≤ 1 % of span

Repeatability

± Detection limit or ± 1 % of reading, whichever is greater (depending on the gas and application)

Zero drift

Due to the measuring principle, there is no zero point drift.

Output signal fluctuation (2 σ)

≤ 0.5 % of smallest measuring range

Detection limit (4 σ)

≤ 1 % of smallest measuring range

Influences

Flow effect

No effect on the measurement, but the flow will determine the amount of purge gas needed.

Associated gas effect/cross sensitivity

No cross sensitivity within normal operation conditions.

Temperature influence (depending on application)

- Ambient temperature in permitted range:
No significant influence
- The temperature of the measured gas is taken into account by the analyzer so that the measured value can be corrected internally.
 - If the gas temperature is constant, a fixed value can be stored in the analyzer.
 - If the gas temperature varies, an external temperature signal (4 to 20 mA) can be used for internal compensation.

Influence of pressure (depending on application)

- At zero point:
No influence effect.
- The pressure of the measured gas is taken into account by the analyzer so that the measured value can be corrected internally.
 - If the gas pressure is constant, a fixed value can be stored in the analyzer.
 - If the gas pressure varies, an external pressure signal (4 to 20 mA) can be used for internal compensation.

Power supply effect

DC 24 V ± 5 %:
 ≤ 0.2 % of measuring span

Dynamic response

Warm-up time

< 15 min (depending on environment)

Response time

< 2 s

Calibration

Zero point check

With nitrogen or with ambient air free of sample components. The zero point cannot be calibrated. Due to the measuring principle, there is no zero point drift.

End point check

A review of the calibration data is recommended every 6 to 12 months, depending on the application

Validation

Depending on the application, online validation is possible using the optional internal or external validation cell

Calibration interval

Depending on the application;
typically once or twice a year

End point calibration

With test gas and a calibration cell.

Materials

Purge and alignment unit

Stainless steel 316SS.

Window

BK7 glass, optional: Synthetic quartz glass or sapphire glass

... Laser analyzer LS25

Mounting

Installation site requirements

The mounting location strongly influences the measurement result. The measurement gas must be well stirred at the selected location to produce a representative measurement result.

- Stratification in the measurement gas path results in erroneous measurement.
- If the measurement gas is charged with dust, it is recommended to mount the LS25 at right angles to the process gas flow.

Adjustment or installation flanges

Adjustment and installation flanges are available in the following variants and are compatible with:

- DN 50/PN 10 to 40, DN 80/PN 10 to 40, DN 100/PN 10 to 40,
- ANSI 2"/150 lbs, ANSI 2"/300 lbs, ANSI 3"/150 lbs,
- ANSI 3"/300 lbs, ANSI 4"/150 lbs, ANSI 4"/300 lbs

Note

The maximum permissible process pressure for the alignment flange is 1.5 bar absolute; an isolation flange must be used for higher pressures.

Alignment tolerance

Flanges parallel within 1.5°

Purging of windows

Compressed air or nitrogen, dry and oil-free (see **Purge gas properties** on page 48)

Gas ports for purging

Choice of 6, 8, 10, 12 mm, 3/8" or 1/4" Swagelok® fitting.
For connection drawing, see **Flange and housing purge connection diagram** on page 54.

Weight

- Transmitter unit: 6.3 kg; Ex version: 7.9 kg
- Receiver unit: 3.9 kg
- Power supply units: Traco 1.6 kg or Pepperl+Fuchs 5 kg

Dimensions

Refer to **Dimensions, position of the purging connections and installation of cables** on page 53.

Electrical connections

Connection to AO2000 system housing

Ethernet 10/100BASE-T; RJ45 plug;
cable length: Min. 15 m, max. 100 m

Connection to receiver unit

15-pole female Sub-D connector
Cable length: Min. 5 m, max. 150 m

Power supply, external pressure and temperature signals

15-pole male Sub-D connector

- Cable length laser unit power supply:
Min. 3 m, max. 100 m

Note

With Ex devices, the cables are not connected via connectors, but are already connected by means of a cable gland and internal terminals upon delivery.

Service computer

RS232, 9-pin female Sub-D connector; Ethernet

Connection diagrams

Refer to **Dimensions, position of the purging connections and installation of cables** on page 53.

Power supply

Input voltage

The transmitter unit is supplied with voltage via an external power supply unit. The power supply unit is optionally included in the scope of delivery

- Transmitter unit:
24 V DC, ±5 %
- Power supply unit:
Input 85 to 264 V AC, output 24 V DC

Power

Max. 20 W

Use in Potentially Explosive Atmospheres

The LS25 has ATEX, IECEx and CSA certificates for use in potentially explosive atmospheres.

The external power supply is suited for use in ATEX Zone 2 and CSA Class I, Division 2.

Electrochemical oxygen sensor

Note

- The oxygen sensor is always associated with an analyzer module and must be installed in the same housing with that analyzer module.
- The oxygen sensor can be used with the following analyzer modules:
 - Uras26, Limas21 UV with gas lines made of FPM.

Measuring principle

Electrochemical oxygen sensor

Sample components and measurement ranges

Sample component

Oxygen (O₂)

Smallest measuring range

0 to 5 vol.% O₂

Measuring range quantity and measuring range limits

1 to 2 measuring ranges

adjustable from 0 to 5 vol. % O₂ to 0 to 25 vol. % O₂

Stability

The following data only applies if all the influence variables (e.g. flow, temperature and air pressure) are constant. They relate to the smallest measurement range.

Linearity error

≤ 1 % of measuring span

Repeatability

≤ 0.5 % of span

Zero drift

Stable over long-term due to absolute zero point

Span drift

≤ 1 % of the measurement range per week

Output signal fluctuation (2 σ)

≤ 0.2 % of the total measuring range at electronic

T₉₀-time (static/dynamic) = 5/0 s

Detection limit (4 σ)

≤ 0.4 % of the total measuring range with electronic

T₉₀-time (static/dynamic) = 5/0 s

Influences

Flow effect

Flow rate in the 20 to 100 l/h range:

≤ 2 % of the total measuring range

Temperature effect

Ambient temperature in the permissible range:

≤ 0.2 vol.% O₂ per 10 °C

Air pressure effect

- At the zero point:
no influence effect
- On sensitivity without pressure correction:
≤ 1 % of the measured value per 1 % of air pressure change
- on sensitivity without pressure correction
≤ 0.2 % of the measured value per 1 % air pressure change
Pressure correction is only possible if the oxygen sensor is connected to an analyzer module with an integral pressure sensor.

Power supply effect

Voltage and frequency in the permissible range:

≤ 0.2 % of the total measuring range

Dynamic response

T₉₀ time

T₉₀ ≤ 30 sec, depending on sample gas flow and system layout

Calibration

Calibration	Test gas
Zero-point calibration	The oxygen sensor zero is not calibrated since it is fundamentally stable.
End-point calibration	Ambient air with 20.96% Vol.-% O ₂ or with synthetic air

Materials

- Sensor:
polystyrene ABS, PTFE, FPM (fluoro rubber)
- Housing:
PVC-U, FPM gasket (fluoro rubber)
- Gas connections:
Stainless steel 1.4571 (AISI 316Ti)

... Electrochemical oxygen sensor

Sample gas conditions

Sample gas inlet conditions

Electrochemical oxygen sensor - Sample gas input conditions

Temperature

If the sample gas taken from the process is hotter than the coldest point in the sample gas path, it can condensate there, if the gas contains components that can condense. Therefore, the sample gas dew point should be at least 5 °C below the lowest temperature throughout the sample gas path. Otherwise a sample gas cooler or condensate trap is an absolute requirement.

Moisture content

H₂O dew point ≥ 2 °C

The oxygen sensor may not be used with dry sample gases.

Pressure

Internal pressure drop: < 5 hPa at standard flow rate of 60 l/h

Flow rate 20 to 100 l/h

Associated gas

The oxygen sensor may not be used if the associated gas contains the following components:

H₂S, compounds containing chlorine or fluorine, heavy metals, aerosols, mercaptans, alkaline components

Requirements for the sample gas outlet

The analyzer is operated under atmospheric pressure; the sample gas outlet is open to atmosphere.

Pneumatic Module

Note

- The pneumatics module is always associated with an analyzer module and must be installed in the same housing with that analyzer module.
- The pneumatics module cannot be used when stainless steel tubes are used for the internal gas lines.
- The pneumatics module cannot be used with the following analyzer modules:
 - Limas21 UV, Limas21 HW with stainless steel, PFA or PTFE gas lines,
 - Fidas24, Fidas24 NMHC,
 - Analyzer modules in category 2G.

Test gas supply

Version

Choice of one or three 3/2-way solenoid valves

Power

Approx. 3 W per solenoid valve

Materials

PVDF, FPM, aluminum, stainless steel 1.4305

Fine filtration

Version

Disposable filter with borosilicate glass microfiber filter element

Retention rate

99.99 % for particles > 0.1 µm

Materials

Polyamide, borosilicate glass with PVDF binder

Gas supply

Version

Magnetic piston pump

Feed rate

Max. 60 l/h, depending on analyzer module and inlet/outlet pressure

Flow

Adjustable

Power

approx. 10 W

Materials

PVDF, EPDM, stainless steel 1.4571

Flow monitor

Version

Miniature flow sensor

Display and limit value monitoring

Configurable

Materials

Al₂O₃, silicon, gold, GFK

Pressure monitoring

Pressure sensor

(Optional) for additional monitoring tasks,
e.g. pressure measurement in the second gas path of the
Uras26 analyzer module

Sample gas inlet conditions

The pneumatics module must not be used for measurement of flammable gases and ignitable gas/air or gas/oxygen mixtures.

Pneumatic module – sample gas inlet conditions

Temperature

5 to 45 °C (41 to 113 °F)

The sample gas dew point should be at least 5 °C below the temperature throughout the sample gas path. Otherwise a sample gas cooler or condensate trap is required.

Pressure

Inlet pressure	p _e = -80 to +20 hPa
----------------	---------------------------------

Flow rate	30 to 60 l/h
-----------	--------------

Corrosive gases

Corrosive associated gas components and aerosols must be cooled or undergo prior absorption.

Use in potentially explosive atmospheres

Explosion protection acc. to ATEX / IECEx

Uras26, Magnos28, Caldos25 and Caldos27

The AO2000 Series gas analyzers with Uras26, Magnos28, Caldos25 and Caldos27 in category 3G for measurement of flammable and non-flammable sample gas ('Safety concept') satisfy the European standards EN 60079-15:2010, EN 60079-2:2014, EN 60664-1:2007.

Version in category II 3G for measurement of flammable and non-flammable gases ('Safety Concept')

Analyzer modules for the "Safety Concept":

- Uras26 in the version with safety cell and purged sample cell windows.
- Magnos28, Caldos25 and Caldos27 in the version with direct sample chamber connection and purged analyzer module housing.

The analyzer modules are built into the 19" housing (model AO2020) or in the wall-mounted housing (model AO2040).

Monitoring of the purge gas flow rate is a feature of the 'Safety Concept'. It is fully integrated into the gas analyzer, together with the controls and signal processing.

The version complies with the Directive 2014/34/EU (ATEX directive).

There are the following explosion protection measures in the gas analyzer:

- Non-sparking assemblies and components/non-incendive components/gasketed (sparking) devices in accordance with EN 60079-15 and
- Simplified positive pressurized enclosure per EN 60079-2.

Gas connections

Refer to **Gas connections 'Safety concept'** on page 61.

... Use in potentially explosive atmospheres

... Version in category II 3G for measurement of flammable and non-flammable gases ('Safety Concept')

Sample gas inlet conditions

'Safety Concept' – Sample gas inlet conditions

Sample gas

Flammable and non-flammable gases and vapors are not explosive in standard operation, if they are potentially explosive in the event of a malfunction, then only rarely and for a short time (according to Zone 2).

Absolute pressure ≤ 1.1 bar

Oxygen content ≤ 21 vol. %

Temperature class T4

Sample gas pressure

On the sample gas inlet: Gauge pressure $p_e \leq 3$ hPa

On the sample gas outlet: atmospheric

Sample gas flow Max. 40 l/h

Sample gas shut off

The operator has to guarantee the disconnection of the sample gas in case of the decommissioning of the gas analyzer and in case of an alarm (failure at the pressurized enclosure) in accordance with the additional special conditions for operation with flammable sample gases.

If the sample gas is a mixture only of oxygen and flammable gases and vapors, it must not be explosive under any conditions. As a rule, this can be achieved by limiting the oxygen content to a maximum of 2 vol.-%.

Flammable gases and vapors that are explosive under the conditions encountered in analysis even when oxygen is excluded should be present in the mixture only in concentrations that are not critical to safety.

Purge gas for pressurized enclosure

'Safety Concept' – Purge gas inlet conditions

Purge gas (protective inert gas)	Inert gas (N ₂)
Connections	Purging gas inlet: "Analyzer Purge In", Purge gas outlet: 'Analyzer Purge Out'
Flow rate	- During operation: 15 to 20 l/h - During initial purge: 15 to 40 l/h
Pressure	Positive operating pressure $p_e \geq$ sample gas pressure + 0.5 hPa
Initial purge*	Compliance with the above purge gas flow rate is monitored in the gas analyzer. - Uras26: 1.6 minutes at a minimum of 15 l/h; - Magnos28, Caldos25, Caldos27: 18 minutes at a minimum of 15 l/h or 7 minutes at 40 l/h
Operation	The required overpressure of ≥ 0.5 hPa is reliably generated in the purge process compared to the sample gas via a capillary arranged in the purge gas path during the above purge gas flow.
Cable connectors not in use have to be closed with suitable vent plugs.	If the installation site of the gas analyzer is hazardous, An alarm is triggered if the flow rate falls below the minimum flow rate of 15 l/h (corresponding to approx. 7 hPa overpressure in the flush curtain) and if the maximum flow rate of 40 l/h (corresponding to approx. 50 hPa) is exceeded.

* Pre-purging is not necessary if it can be proven that there is no flammable sample gas in the sample gas path or in the purging gas path.

Gas connections 'Safety concept'

Figure 4: 'Safety Concept' gas connections Uras 26, Magnos28

Figure 5: 'Safety Concept' gas connections Caldos25, Caldos27

... Use in potentially explosive atmospheres

Version in category II 3G for measurement of non-flammable gases

The explosion-proof design in category II 3G for the measurement of non-flammable gases and vapors is a special version of the gas analyzers of the AO2000 series.

The analyzer modules Uras26, Magnos28, Magnos27, Caldos25, Caldos27 and the electrochemical oxygen sensor are suited for measuring non-flammable gases.

The analyzer modules are mounted in the central unit housing or in a separate housing (either wall-mount or 19" rack unit).

The version complies with the Directive 2014/34/EU (ATEX directive).

The gas analyzer is protected by measures in accordance with EN 60079-15 (non-sparking electric equipment, gasketed sparking devices).

In undisturbed operation, there cannot be any sparking, arcing or impermissible temperatures inside the device.

NOTICE

Potential adverse effect on the IP rating

Yellow sealing plugs (transport protection) are applied to the gas connections on the analyzer and housing to secure them during transport. The yellow sealing plugs do not guarantee a sufficient IP rating.

- Remove the yellow sealing plugs before commissioning.
- Close unused gas connections with suited sealing plugs to guarantee the IP rating.

IP 54

General data

Operation

LCD display

Backlit graphics display, 320 x 240-pixel resolution

Measured value display

Digits with unit and bargraph; simultaneous display of up to 6 measured values, configurable

Units of measure

Selectable in physical units, e.g. ppm, vol.-%, mg/m³ or g/m³, as well as in % of span or mA

Digital value resolution

Better than 0.2 % of span

Status display

- Green LED: Power supply switched on
- Yellow LED: Maintenance required
- Red LED: Failure

Status messages

Plain text

Use

Panel with six soft keys, two cancel keys and 10-digit keypad; menu-driven interface, various languages available

Measuring range switchover and feedback

There are three ways of executing the measuring range switch-over:

- Manually on the gas analyzer
- Automatically ('autorange') by means of appropriate configured switch-over thresholds
- Externally controlled via appropriately configured digital inputs

The measuring range feedback can be implemented via appropriately configured digital outputs; it is independent of the selected type of measuring range switch-over.

Limit value monitoring

Limit values can be set during the gas analyzer configuration. The limit value signals (alarms) are output via digital outputs.

Housing

Versions

19" housing (model AO2020) or wall-mount housing (model AO2040)

Housing materials

- Housing: Stainless steel 1.4016
- Module back panel: Aluminum
- Keyboard foil: Polyester

Housing color

Light gray (RAL 7035), basalt gray (RAL 7012)

Weight

Analyzer unit with one analyzer module:
18 to 23 kg

Dimensions

Refer to **Dimensions** on page 84.

IP rating

The IP rating of the housing depends on the housing design and the analyzer modules installed.

Version / analyzer module	IP20	IP40	IP54	IP65
Without connection box	X			
Version for emission measurement		X		
With connection box and Limas21 HW, Magnos27, Fidas24*, ZO32			X*	
With connection box and Uras26, Limas21, Magnos28, Caldos25, Caldos27				X
Version that can be purged (option) AO2040-Fidas24 Ex			X	X
				X

* IP rating IP54 not for the pressure equalization opening of the Fidas24, see **Gas and electric connections Fidas24 and Fidas24 NMHC** on page 81.

Note

For combinations of analyzer modules, the lower IP rating applies. Example:

When combining Uras26 (IP65) with Magnos27 (IP54), the resulting IP rating is then **IP54**.

... General data

Housing purge

Housing purge is possible with the IP54/IP65 version with connection box.
The version can be fitted with screwed cable glands (in accordance with EN) or with conduit connections (in accordance with CSA).

Purge gas flow during operation max. 20 l/h (Fidas24, Fidas24 NMHC: approx. 300 l/h), purge gas pressure $p_e = 2$ to 4 hPa.
The purge gas should not contain any sample gas components.

Pressure sensor

Use

Analyzer module	Pressure sensor
Uras26, Limas21 UV, Limas21 HW, Caldos27	Factory-installed as standard
Magnos28, Magnos27	Factory-installed as an option
Caldos25, Fidas24, ZO23	Not required

Working range

$p_{abs} = 600$ to 1250 hPa

Materials

Silicone gel, plastics, FPM (Fluorocarbon rubber)

Sample gas composition

The pressure sensor must not be connected to the sample gas path when the sample gas is corrosive, flammable or explosive.

Gas connections

Layout

Gas ports on back (19" rack housing) or bottom (wall-mount housing) of the analyzer module.

Version

$\frac{1}{8}$ NPT female threads for commercially available adapters, e.g. Swagelok®, unless other versions are specified in the specification of the individual analyzer modules.
Refer to **Gas connections** on page 73.

Note

With the IP54 version of the Fidas24, the operator must ensure the IP protection class of the housing by taking additional design measures at the pressure equalization opening.

Electrical connections

Central unit

- Power supply:
3-pin grounded-instrument connector according to EN 60320/C14, connection cable supplied
- Ethernet: two 8-pin RJ45 female connectors
- System bus (3-pin female connector)

Analyzer modules

- Power supply: 4-pin male connector
- Heating of detector and sample gas inlet (Fidas analyzer modules): 4-pin male connector, connection cable included in delivery
- System bus (3-pin female connector)

AO2040-Fidas24 Ex

The power supply cable is connected to the corresponding terminals of the purging and monitoring unit, refer to **Purging and monitoring unit FS870S** on page 83.

Power supply

Power supply unit

The power supply is used to supply 24 V DC to the integrated analyzers and the associated electronics.

Input voltage	100 to 240 V AC, -15 %, +10 %
Input Current	2.2 A max
Line Frequency Range	50 to 60 Hz, ± 3 Hz
Power consumption	Maximum 187 VA
Output Voltage	24 V DC, ± 3 %
Connection	3-pin grounded-instrument connector to EN 60320/C14, connection cable in scope of supply

Power consumption of the analyzer modules

Module	Power consumption
System Controller	approx. 15 W.
I/O modules	each approx. 10 W
Caldos25	Max. 25 W
Caldos27	Max. 17 W
Fidas24	Max. 40 W
Fidas24 NMHC	max. 40 W
Limas21 UV	max. 100 W
Limas21 HW	max. 100 W
LS25	Max. 20 W
Magnos28	Max. 50 W
Magnos27	Max. 35 W
Pneumatic Module	Approx. 20 W
Uras26	Max. 95 W
ZO23	approx. 12/35 W in continuous/starting operation

Fidas24: Heating of detector and sample gas inlet

Input voltage	115/230 V AC, ± 15 % (max. 250 V AC)
Line Frequency Range	50/60 Hz, ± 3 Hz
Power consumption	125 VA for Fidas24 detector, approx. 200 VA for Fidas24 NMHC detector, 125 VA for sample gas inlet (option)
Connection	4-pin male connector, connection cable included in scope of supply

... General data

Safety

In accordance with EN 61010-1

Protection class

- System housing: Protection class I
- Analyzer module: Protection class III

Overvoltage category

II

Pollution degree

2

Safe isolation

The power supply is electrically isolated from other circuits by means of reinforced or double insulation.
Protective Extra Low Voltage (PELV) on low-voltage side.

Electromagnetic compatibility

In accordance with EN 61326-1

Noise immunity

Inspection level: industrial area, fulfills at least the evaluation criteria according to Table 2 of EN 61326-1.

Emitted interference

Limit values class B for electromagnetic radiation disturbance and conducted disturbance are met.

Emitted interference AO2040-Fidas24 Ex

Limit value class A for interference field strength and interference voltage is met.

Mechanical stress

Transport

Vibration test per EN 60068-2-6:1996.
Shock test per EN 60068-2-27:1995.
In its original packaging, the gas analyzer withstands normal shipping conditions.

Requirements for the installation site

Installation location

The gas analyzer is intended for indoor installation only.
The specification of the gas analyzer is applicable up to an altitude of 2000 m above sea level. Altitude above 2000 m on request.

The installation site must be stable enough to bear the weight of the gas analyzer!
For safe installation and disassembly, we recommend supporting the 19" housing in the cabinet or rack with slide rails!

Vibrations/shocks

- If the gas analyzer is installed in a cabinet, the maximum acceleration amplitude may not exceed 0.01 ms⁻² in a frequency range of 0.1 to 200 Hz.
- If the gas analyzer is not installed in a cabinet, the following data for the individual analyzer modules apply.

Analyzer module	Vibration
Uras26	max. ±0.04 mm at 5 to 55 Hz, 0.5 g at 55 to 150 Hz, slight transient effect on measured value in the area of the beam modulation frequency
Limas21 UV	max. ±0.04 mm at 5 to 55 Hz, 0.5 g at 55 to 150 Hz
Limas21 HW	max. ±0.04 mm/0.5 g at 5 to 150 Hz
Magnos28	max. ±0.04 mm at 5 to 20 Hz
Magnos27	max. ±0.04 mm at 5 to 60 Hz
ZO23	max. ±0.04 mm at 5 to 55 Hz, 0.5 g at 55 to 150 Hz
Caldos25	max. ±0.04 mm at 5 to 30 Hz
Caldos27	max. ±0.04 mm at 5 to 55 Hz, 0.5 g at 55 to 150 Hz
Fidas24	Max. 0.5 g, max. 150 Hz
Fidas24 NMHC	Max. 0.5 g, max. 150 Hz
LS25	Max. ±0.6 mm around the optical axis, max. 500 Hz

Note

For compliance with the metrological data, a vibration damped/decoupled installation of the gas analyzer may be necessary in accordance with the vibration effects at the installation site.

Ambient temperature

Analyzer module	During operation when installed in housing	
	without central unit	with central unit
Uras26	+5 to +45 °C	+5 to +40 °C
Limas21 UV	+5 to +45 °C	+5 to +40/45 °C with/without I/O cards

Caldos25	+5 to +45 °C	+5 to +45 °C
Caldos27	+5 to +50 °C	+5 to +45 °C
Fidas24	+5 to +45 °C	+5 to +45 °C
Fidas24 NMHC	+5 to +40 °C	+5 to +40 °C
LS25	-20 to +55 °C, no direct solar radiation	
Oxygen sensor	+5 to +40 °C in 19-inch housing, +5 to +35 °C in wall-mount housing	
Central unit without analyzer module	+5 to +55 °C	

* With direct sample cell connection and when installed in housing without Uras26

Relative humidity

Maximum 75 %, no condensation

Climate class

- 3K3 for housing protection IP 20 (condensation not permitted)
- 3K4 for housing protection IP 54 (condensation permitted) in accordance with EN 60721-3-3: 1995

Air circulation

For sufficient air circulation, multiple housings in a 19" rack must be installed with a separation of at least 1 HU between housings.

Electrical connections

Electronics module

Measured value and signal processing

Processor system with buffered real-time clock and non-volatile memory for firmware and device data.
Software updates can be obtained via the Ethernet interface.

I/O modules

Number of Slots
5 slots (see **Terminal assignment** on page 68)

Specification
Refer to **Figure 6**.

- Notes regarding conductor cross-section**
- The maximum capacity of terminals for stranded or solid conductors is 1 mm² (17 AWG).
 - The stranded conductor may be tinned on the tip or twisted for simplified connection.
 - When using wire end ferrules the total section must not exceed 1 mm², i.e. the maximum stranded conductor section cannot be greater than 0.5 mm². The Weidmüller PZ 6/5 crimping tool must be used for crimping the ferrules.

Interfaces

Ethernet
To connect the gas analyzer to Ethernet networks. TCP/IP protocol and Modbus TCP/IP protocol via 10/100/1000BASE-T interface.
Electrical connection: Two 8-pin RJ45 plugs

System bus
Internal bus for communication between the gas analyzer's functional units.
Electrical connection: 3-pin female connector

Power supply

Input voltage
24 V DC, ±3 % from the power supply built in the system housing (see **Power supply unit** on page 65)

Power
approx. 15 W without I/O modules

Terminal assignment

Gas connections Uras26

Pos.	Connection	Supplementary information	Design
1	Pressure Sensor for external pressure measurement (option)	The pressure sensor is connected to Terminal 1 via an FPM hose if the internal gas lines are designed as PTFE or stainless steel pipes, or if the 'Pressure sensor connected outside by hose' option is ordered.	1/8"-NPT internal thread (stainless steel 1.4305) - Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery) - Connection of pipelines: Screw-in fittings (not included in the scope of delivery)
2	not used	—	
3	Sample gas inlet (gas path 1)	Variant Ⓐ, Ⓑ or Ⓒ.	
4	Sample gas outlet (gas path 1)	For one measuring cell (variant Ⓐ) and for two measuring cells with separate gas paths (variant Ⓒ)	
5	Purge gas inlet (housing)	Option	
6	Purge gas outlet (housing)	Optional, also with flow sensor	
7	Sample gas inlet (gas path 2)	Variant Ⓒ	
8	Sample gas outlet (gas path 2)	Variant Ⓒ	
	Sample gas outlet (gas path 1)	For two sample cells in series (variant Ⓑ)	
9	Reference gas inlet	Optional, sample cell 1 flowing reference gas	
10	Reference gas outlet		

Gas connections pneumatic module (option)

Pos.	Connection	Supplementary information	Design
11	Sample gas inlet (gas path 1)	Variant Ⓐ, Ⓑ or Ⓒ.	1/8"-NPT internal thread
12	Endpoint gas inlet (gas path 1) or sample gas inlet (gas path 2)	With 3 solenoid valves For variant Ⓒ: Gas path 2 (only with flow sensor)	(stainless steel 1.4305) - Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery) - Connection of pipelines: Screw-in fittings (not included in the scope of delivery)
13	Test gas/zero point gas inlet (gas path 1) or sample gas outlet (gas path 2)	With 1 or 3 solenoid valves For variant Ⓒ: Gas path 2 (only with flow sensor) - in this case to be connected to sample gas input 7	
14	Sample gas outlet (gas path 1)	Variant Ⓐ, Ⓑ or Ⓒ – to be connected to sample gas inlet 3

Pos.	Connection	Supplementary information	Design
1	Sample gas inlet	—	1/8"-NPT internal thread
3	Purge gas inlet housing	Option	(stainless steel 1.4305)
4	Sample gas outlet	—	• Connection of hose lines:
6	Purge gas outlet housing	Option	Straight screw-in socket (PP) with hose
7	Pressure sensor	The pressure sensor is routed to the outside via an FPM hose when the internal gas lines are made of PTFE, stainless steel or PFA.	nozzles for hoses with inside diameter 4 mm (included in scope of delivery)
8	End-point gas inlet	Option with 3 solenoid valves, only for version with FPM hoses	• Connection of pipelines:
9	Zero-point gas inlet	Option, with 1 or 3 solenoid valves, only for version with FPM hoses	Screw-in fittings (not included in the scope of delivery)
			Connection to quartz cell with PFA tube
			• PFA 6/4 mm, screw-in fittings (not included in scope of delivery)

Figure 15: Limas21 UV and HW gas connections

Limas21 UV gas connections

Pos.	Connection	Supplementary information	Design
1	Sample gas inlet	—	Stainless steel tube with
2	Sample gas outlet	—	4 mm outer diameter
3	Purge gas inlet housing	Option with Limas21 UV	1/8-NPT internal thread (stainless steel 1.4305)
4	Purge gas inlet sample cell	—	FPM Pipe 4 × 1.5 mm
5	Purge gas outlet sample cell	—	
6	Purge gas outlet housing	Option with Limas21 UV	1/8-NPT internal thread
7	Pressure sensor	The pressure sensor is routed to the outside via an FPM hose.	(stainless steel 1.4305)

Limas21 HW gas connections

Pos.	Connection	Supplementary information	Design
1	Sample gas inlet	—	1/8-NPT internal thread
3	Purge gas inlet housing	—	(stainless steel 1.4305)
4	Sample gas outlet	Install the exhaust air line at a gradient, leading away from the gas analyzer.	
6	Purge gas outlet housing	—	
7	Pressure sensor	The pressure sensor is routed to the outside via an FPM hose.	

... Gas connections

Magnos28

Figure 16: Magnos28 gas connections

Magnos28 gas connections

The sample cell is connected directly to the gas ports.

Pos.	Connection	Supplementary information	Design
1	Sample gas inlet	—	1/8 NPT internal thread
2	Sample gas outlet	—	(stainless steel 1.4305)
3	Purge gas inlet analyzer	Option	- Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery) - Connection of pipelines: Screw-in fittings (not included in the scope of delivery)
4	Purge gas outlet analyzer		
7	Purge gas inlet housing	Option	
8	Purge gas outlet housing	Optional, also with flow sensor	
9	Pressure sensor 1	Option. The pressure sensor is routed to the outside via an FPM hose. For measurements in suppressed measurement ranges, the sensor 9 and sample gas 2 outlet have to be connected to each other via a T-piece and with the use of short conductors.	
10	Pressure Sensor 2	Option. Second pressure sensor for additional external pressure measurement	

Gas connections pneumatic module (option)

Pos.	Connection	Supplementary information	Design
11	Sample gas inlet	—	1/8 NPT internal thread (stainless steel 1.4305)
12	End-point gas inlet	With 3 solenoid valves	Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery)
13	Test gas/zero point gas inlet	With 1 or 3 solenoid valves	
14	Sample gas outlet	To be connected to sample gas inlet 1	Connection of pipelines: Screw-in fittings (not included in the scope of delivery)

Magnos27

Figure 17: Magnos27 gas connections

Magnos27 gas connections

Note on the direct connection of the sample chamber

The sample cell is connected directly to the gas ports (for wall-mount housing only). Application e.g. when external gas supply is connected and for short T_{90} times.

Pos.	Connection	Supplementary information	Design
1	Purge gas inlet housing	Option	1/8"-NPT internal thread
2	Purge gas outlet housing	Optional, also with flow sensor	(stainless steel 1.4305)
3	not used	—	• Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery)
4	Sample gas inlet	—	• Connection of pipelines: Screw-in fittings (not included in the scope of delivery)
5	Purge gas inlet analyzer	—	
6	Purge gas outlet analyzer	—	
7	Sample gas outlet	—	
8	not used	—	
9	Pressure sensor 1	Option. The pressure sensor is routed to the outside via an FPM hose.	
10	Pressure Sensor 2	Option. Second pressure sensor for additional external pressure measurement	

Gas connections pneumatic module (option)

Pos.	Connection	Supplementary information	Design
11	Sample gas inlet	—	1/8"-NPT internal thread (stainless steel 1.4305)
12	End-point gas inlet	With 3 solenoid valves	• Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery)
13	Test gas/zero point gas inlet	With 1 or 3 solenoid valves	• Connection of pipelines: Screw-in fittings (not included in the scope of delivery)
14	Sample gas outlet	To be connected to sample gas inlet 4	

... Gas connections

ZO23

Figure 18: ZO23 gas connections

ZO23 gas connections

The measuring chamber is connected to sample gas inlet connection **1** via a stainless steel pipe and to sample gas outlet connection **2** via an FPM hose.

Pos.	Connection	Supplementary information	Design
1	Sample gas inlet	—	3 mm Swagelok® screwed connection
2	Sample gas outlet	—	1/8-NPT internal thread
7	Purge gas inlet housing	Only for IP54/IP65 version	(stainless steel 1.4305)
8	Purge gas outlet housing	Only for IP54/IP65 version	• Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery) • Connection of pipelines: Screw-in fittings (not included in the scope of delivery)

Caldos25

Figure 19: Caldos25 gas connections

Caldos25 gas connections

The sample cell is connected directly to the gas ports.

Pos.	Connection	Supplementary information	Design
1	Sample gas inlet	—	1/8"-NPT internal thread
2	Sample gas outlet	—	(stainless steel 1.4305)
3	Purge gas inlet analyzer	—	• Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery)
4	Purge gas outlet analyzer	—	• Connection of pipelines: Screw-in fittings (not included in the scope of delivery)
5	Reference gas inlet	Not in version for corrosive sample gas	Note Gas connections 1 to 6 in the versions for corrosive sample gas or for flowing reference gas are made of PVC-C. Do not use metal tubing connectors or adapters!
6	Reference gas outlet		
7	Purge gas inlet housing	Option	
8	Purge gas outlet housing	Optional, also with flow sensor	
9	Pressure sensor 1	Option. The pressure sensor is routed to the outside via an FPM hose.	
10	Pressure Sensor 2	Option. Second pressure sensor for additional external pressure measurement	

Pneumatic module gas connections (optional – not in version with sample cell direct connection)

Pos.	Connection	Supplementary information	Design
11	Sample gas inlet	—	1/8"-NPT internal thread (stainless steel 1.4305)
12	End-point gas inlet	With 3 solenoid valves	• Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery)
13	Test gas/zero point gas inlet	With 1 or 3 solenoid valves	• Connection of pipelines: Screw-in fittings (not included in the scope of delivery)
14	Sample gas outlet	To be connected to sample gas inlet 1	

... Gas connections

Caldos27

Figure 20: Caldos27 gas connections

Caldos27 gas connections

The sample cell is connected directly to the gas ports.

Pos.	Connection	Supplementary information	Design
1	Sample gas inlet	—	1/8"-NPT internal thread
2	Sample gas outlet	—	(stainless steel 1.4305)
3	Purge gas inlet analyzer	—	- Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery) - Connection of pipelines: Screw-in fittings (not included in the scope of delivery)
4	Purge gas outlet analyzer	—	
7	Purge gas inlet housing	Option	
8	Purge gas outlet housing	Optional, also with flow sensor	
9	Pressure sensor 1	The pressure sensor is routed to the outside via an FPM hose.	
10	Pressure Sensor 2	Option. Second pressure sensor for additional external pressure measurement	

Gas connections pneumatic module (option)

Pos.	Connection	Supplementary information	Design
11	Sample gas inlet	—	1/8"-NPT internal thread (stainless steel 1.4305)
12	End-point gas inlet	With 3 solenoid valves	- Connection of hose lines: Straight screw-in socket (PP) with hose nozzles for hoses with inside diameter 4 mm (included in scope of delivery) - Connection of pipelines: Screw-in fittings (not included in the scope of delivery)
13	Test gas/zero point gas inlet	With 1 or 3 solenoid valves	
14	Sample gas outlet	To be connected to sample gas inlet 1	

Fidas24

Figure 21: Gas and electric connections Fidas24 and Fidas24 NMHC

Gas connections of the analyzer

Pos.	Connection	Additional information	Design
32	Test gas outlet	—	1/8 NPT female thread for threaded connections
33	Zero-point gas inlet	—	(not included in scope of supply)
34	End-point gas inlet	—	
35	Combustion air inlet	—	
36	Combustion gas inlet	—	
37	Instrument air inlet	—	
38	Exhaust outlet	Notice The inside diameter of the exhaust line must be increased to $\varnothing \geq 10$ mm a maximum of 30 cm downstream of the exhaust outlet. Install the exhaust air line at a gradient, leading away from the gas analyzer.	Compression fitting for pipes with an outside diameter of 6 mm
39	Sample gas inlet	Sample gas line connection To heated sample gas inlet: - In wall-mount housing: bottom and right - In 19" housing: back, top and bottom To unheated sample gas inlet: - In wall-mount and 19" housing: back	Fitting for PTFE tubes or stainless steel tubes with an outer diameter of 6 mm
40	Pressure equalizing opening	With protective filter (the protective filter must be protected against humidity)	—

Note

With the IP54 version of the Fidas24, the operator must ensure the IP protection class of the housing by taking additional design measures at the pressure equalization opening.

Electrical connections

Pos.	Connection	Additional information	Design
30	Power supply 115 / 230 V AC	For heating the detector with converter and sample gas inlet	4-pin male connector, connection cable included in scope of supply
31	Power supply (output)	Electrical connection to the heated sample gas connection	Permanently connected

... Gas connections

Fidas24 Ex

Figure 22: Position of the gas connections AO2040-Fidas24 Ex

Pos.	Connection	Supplementary information	Design
35	Combustion air inlet	—	1/8" NPT female thread for threaded connections (not included in scope of supply)
36	Combustion gas inlet	with pre-assembled flow restrictor	
37	Instrument air inlet	—	
38	Exhaust outlet	—	Male thread for connection of the exhaust air pipe (stainless steel tube with an outside diameter of 10 mm, included in the scope of supply of the gas analyzer)
39	Sample gas inlet	Connection options for heated or unheated sample gas lines.	G 1/4" NPT female thread for threaded connections (not included in scope of supply)
A	Purging gas inlet	Purging gas inlet for the pressurized enclosure Ex-p.	G 3/8" NPT female thread for threaded connections (not included in scope of supply)

Purging and monitoring unit FS870S

① Purging and monitoring unit FS870S

② Pressure switch for monitoring of the instrument air

③ Key switch for EPL Dc / Db design

④ Magnetic valve for the purging gas

⑤ Fuse for purging gas solenoid valve

Image 23: Purging and monitoring unit FS870S

Note

The components ②, ③, ④, ⑤ as well as the power supply to the gas analyzer are pre-wired at the factory.

Connections for power supply on the FS870S purging and monitoring unit

Terminal	Function/comments
19 / N	Neutral conductor
21 / L	Phase
23 / PE /	Protective earth (PE)

Relay output connections

Terminal	Function/comments
28 / 29	Relay output 1 / 2
30 / 31	De-energize the gas analyzer, pre-wired at the factory
32	Alarm output
33	Potential-free relay output for external signal transmitter, maximum 235 V AC, 5 A

Connections for intrinsically safe inputs/outputs

Terminal	Function/comments
1 / 2	Not assigned
3 / 4	Not assigned
5 / 6	Input "Ext. Alarm" Connected to the pressure switch internally, for monitoring of the instrument air supply. With devices for category 3D / 2D (Dc / Db), the additional key switch is also connected here.
7+ / 8-	Not assigned
9+ / 10-	Not assigned

Dimensions

19” housing (model AO2020)

Dimensions in mm (in)

Figure 24: AO2020 dimensions

Wall-mount housing (model AO2040)

Dimensions in mm (in)

(A) Consider free space to swivel the door

Figure 25: AO2040 dimensions

Additional information

- In the IP54/IP65 version, the connection box shown in the dimensional drawings is flange-mounted to the housing.
- Adhere to the requirements at the installation site, refer to **Requirements for the installation site** on page 66.
- Take into consideration the additional space required for the connecting lines (approx. 100 mm).
- During installation of the Fidas24 gas analyzer with heated sample gas connector, take into consideration the additional space requirement for the heated sample gas impulse line (observe minimum bend radius in accordance with manufacturer data).
- When installing the wall unit, make sure to provide free space on the left side needed to swing out the door (approx. 60 mm).
- When installing the wall-mounted housing, ensure that there is additional free space above the housing, as some modules are only accessible from the top (approx. 300 mm).
- Install both the 19" housing and the wall unit such that the display is oriented vertically.
- For sufficient air circulation of several system housings in a 19" rack unit, mount with a distance of at least 1 HU between each other.

Note

With the IP54 version of the Fidas24, the operator must ensure the IP protection class of the housing by taking additional design measures at the pressure equalization opening.

... Dimensions

Model AO2040-Fidas24 Ex

Dimensions in mm (in)

Figure 26: Dimensions, Model AO2040-Fidas24 Ex

Additional information

- The connection box shown in the dimensional drawings is flange-mounted to the housing.
- Adhere to the requirements at the installation site, refer to **Requirements for the installation site** on page 66.
- The air outlet of the purging and monitoring unit must not be blocked.
- Take into consideration the additional space required for the connecting lines (approx. 100 mm).
- When mounting the gas analyzer, take the space required for the heated sample gas lines into account (observe the minimum bending radius, according to manufacturer's specifications).
- When installing the wall-mounted housing, ensure that there is additional free space above the housing, as some modules are only accessible from the top (approx. 300 mm).
- Mount the wall-mounted housing in such a way that the LCD display is clearly visible.

Approvals, tests and certificates

Performance tests

The gas analyzers of the AO2000 series Uras26 (measuring components CO, NO, SO₂, CO₂, N₂O) and electrochemical oxygen sensor (measuring component O₂) are suited for use in incineration plants that require approval in accordance with European Directives 2001/80/EC (13th BlmSchV) and 2000/76/EG (17th BlmSchV) as well as in annexes of the 27th/30th BlmSchV and TA-Luft.

The requirements of QAL1 according to EN 15267 and EN 14181 are fulfilled.

- Report no. 821029 dated 6/30/2006;
Announcement: BAnz of 10/14/2006, No. 194, page 6715.
- Report no. 1249694 dated 3/30/2009;
Announcement: BAnz of 8/25/2009, No. 125, page 2932.
- Report no. 1710933 dated 9/30/2011;
Announcement: BAnz of 3/2/2012, No. 36, page 923.
- Report no. 936/21217137/A dated 10/14/2011;
Announcement: BAnz of 3/2/2012, No. 36, page 922.
- Report no. 1958844 dated 8/30/2013,
Announcement: BAnz AT of 4/1/2014, No. B12, page 15.

Uras26, Magnos28, oxygen sensor

The AO2000 Series gas analyzers Uras26 (sample components CO, NO, NO_x, SO₂, N₂O, CO₂), Magnos28 (sample component O₂) and electrochemical oxygen sensor (sample component O₂) meet the requirements of the 'MCERTS Performance Standards for Continuous Emission Monitoring Systems, Version 3.5 dated June 2016', EN 15267-3:2007 and QAL 1 in accordance with EN 14181:2014.

Certificate no. Sira MC080121/13 of 8/18/2017

Limas21 UV

The gas analyzers of the AO2000 series Limas21 UV (measuring components NO, NO₂, SO₂), and electrochemical oxygen sensor (measuring component O₂) are suited for use in incineration plants that require approval in accordance with European Directives 2001/80/EC (13th BlmSchV) and 2000/76/EG (17th BlmSchV) as well as in TA-Luft systems. The requirements of QAL1 according to EN 15267 and EN 14181 are fulfilled.

Report no. 2231669.1 dated 9/1/2015;

Announcement: BAnz AT of March 14, 2016, No. B7, page 2.

Fidas24

The gas analyzer of the AO2000 series Fidas24 (measuring component Total-C) is suited for use in systems that require approval (13th BlmSchV, 17th BlmSchV, 30th BlmSchV, TA-Luft) as well as in the annexes of the 27th BlmSchV. The requirements of QAL1 according to EN 15267 and EN 14181 are fulfilled.

Report no. 936/21228173/A dated 10/21/2015;

Announcement: BAnz AT of March 14, 2016, No. B7, page 2.

Uras26 – Marine

The AO2000 Series gas analyzer Uras26 (sample components SO₂ and CO₂) is suited for use on vessels. The requirements of MEPC.184(59) and MEPC.259(68), Chapter 6 'Emission Testing' as well as the relevant requirements of Revised MARPOL Annex VI and NO_x Technical Code 2008 are fulfilled. Certificate No. 30652-15 HH of November 27, 2015

Limas21 UV – Marine

The AO2000 Series gas analyzer Limas21 UV (sample components NO, NO₂ and NO_x) is suited for use on vessels. The requirements of Revised MARPOL Annex VI and NO_x Technical Code 2008 are fulfilled.

Certificate no. Doc no: 31786686/DNV; Issued in Hamburg on December 14, 2023

CE conformity

The AO2000 series gas analyzers satisfy the requirements of the European directives:

- 2014/35/EU Low Voltage Directive,
- 2014/30/EU EMC Directive,
- 2014/34/EU ATEX Directive (explosion-proof designs only) and
- 2011/65/EU RoHS Directive

Approval for USA and Canada – CSA

The AO2000 series gas analyzers are certified for use in 'general purpose' environments, evidenced by full compliance with standards CAN/CSA-C22.2 no. 61010-1-12 and UL Std. No. 61010-1 (Third Edition).

Certificate No. 70012655

Approval for the customs union of Russia, Belarus and Kazakhstan – EAC TR CU

The AO2000 Series gas analyzers are certified for use in general purpose environment.

- EAC TR CU Certificate:
EA3C N RU Д-DE.HB26.B.0014519
- Metrological certificate for Russia:
No. 79593-20
